Hi Dave, I know nothing about ASK radio modem.
I think you can get a triangle wave out of a 555 (Or some other charge/discharge osc.) You can then low pass filter the triangle to get rid of the sharp peaks.. There are also some trianlge wave to sine wave converter circuits that use diodes or transistors to 'smooth' the tiangle wave. If you don't care too much about harmonic content then either approach may work.

George H.

Hey OM:

ASK is CW pure and simple. What you have is infinitely variable speed CW. And some times the speed varies so much you can't tell if it's a dit or a dah.

You can't beat CW, no way, no how, for the best source, of signal, in an EMI environment.
Towit you can't beat ASK either.

Just keep on doing what you are doing.

As for square wave for audio, we are looking at an infinite number of harmonics in a square wave, and that may be a good thing, but is it what you want?

73 OM
de n8zu

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

I think you mean "AFSK". At least that's what I think you mean. ASK =3D
Amplitude Shift Keying.

Something in the transmitter chain stops (or should stop!) the square
wave from being square with all the odd harmonics going out to
infinity.

This something may be in the audio stage (example: low pass audio filter), or the IF stage (example: bandpass filter), or in the RF stage (example: tuned circuits).

It is very doubtful that after going through the transmitter and receiver that it'll come out as a square wave on the other end. Choosing to transmit a square wave audio waveform is usually a poor choice because you know that it can't come out looking that pretty on the other end. This sort of design decision might be made for a very low-end radio control transmitter of the 60's or 70's out of ignorance, but today we know how to do far better with little extra effort.

Most designs make a conscious choice to be a friendly transmitter, and limit splatter and unnecessary bandwidth that would be in violation of the FCC rules, by running any square wave through a low pass audio filter AND additionally using a rational choice for the IF filtering too. Way better than nothing, is a simple RC low pass in the audio stage. Still to be nice the resulting audio level has to be carefully set to not cause splatter in subsequent stages.

Tim N3QE

Hey OM

I looked at this guys profile.

I would say he's into telemetry.

If you want to stay away from EMI take it to the 2.4Ghz band.

I don't think he's a ham..

I think he cross forumed this post.

My best guess is he is running into trouble on the VHF/UHF spectrum
where there is tonnes o EMI. QRN and QRM.

Hi all,
I was given a fantastic birthday present, my own domain :-)

So if you had trouble trying to remember http://web.telia.com/~u85920178/
then fear not for www.sm0vpo.com is the new URL.

Bery best regards from Harry - SM0VPO

Posting-Frequency: posted monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

 radio/personal-intro
 Subject: Guide to the rec.radio Newsgroups
 Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
 Last Posted: 9 Nov 2001 06:18:17 GMT
 Posting-Frequency: 15th of each month

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to rec-radio-info-request@panix.com.

You maybe knowing your microwave's inner workings.
It uses a microwave valve which consists of LC chambers of 2.4 GHz.
And they are excited with a dc hv of must be 50 Hz.

Now we have two possibilities, the output is in trains or constant rf output.

Who of the hams here can messure that output ?

The transformer has a core bypass to handle the reactive load. There is
a power rectifier and a capacitor to (somewhat) smooth the 1KV output.
Still, magnetrons are sensitive to the cathode volts they see, so the
output varies somewhat in frequency and amplitude at line frequency.

Does anyone have the schematic of the Pasokon SSTV interface board please?
Mine (interface) has developed a fault and I want to fix it.
Thanks. Howard.

   So like a Teslacoil one is able to generate 2.4 GHz with strikes of only 50
Hz ?
   How can the rf waves prolong so long ?  A few cycles of 2.4 GHz o.k. but
   it looks like almost a continues wave.
   You try that on sw or mw.  It should work even better there.

The messure of output in trains rf output with a dc hv of must be 50 Hz into
LC chambers of 2.4 GHz .
Then you maybe knowing your microwave's inner workings and cooking of your
hams may possible!

In amateur radio parlance, "homebrew" means "to make one's own equipment". It's a metaphor that _refers_ to the act of brewing one's own beer -- it doesn't literally mean amateur radio operators who also brew beer.

(Although I'll bet that radio amateurs who build their own equipment are also more likely to brew their own beer).

Sorry I thought I took this message out. I built my own ham equipment
back in the day. In fact I'm selling some 6M equipment if anybody is
interested. But ya, I thought I deleted this email. Wasn't paying
attention to the group name. Sorry about that.

For that matter you can also get a T-37-6 or T-50-6 toroid and make your
own transformer. You'll have to use a trimmer cap to tune it since
toroids don't have tuning slugs but the end result won't be much bigger.
www.kitsandparts.com has toroids cheaper than anybody else and they have
all the winding data on their site.

Many old TRF schematics went left-to-right and then right-to-left.
This was done, I believe, to make it all fit on a 'standard' sized sheet
of paper. The antenna input was in the upper left -- with the RF
sections runing on towards the right. Just before, or just after, the
diode detection, the signal path would drop down the righthand side of
the schematic and then audio section(s) would run left-to-right.

Does anybody have a copy of the manual for Puff 2.1? Also is the source code available anywhere for download? I have a copy of the program for a DOS version, seems to work with DosBox in Linux, however if I can get the source code there is a way to recompile it to run natively under Linux.

Hey Old Timer:

Yeah and in China they read from bottom to top, so the grounds would
be at the top of the page and pointing up not down, and your B pluses
would be where our ground would be.

I have one word: ISO, says it all.
and IEEE would be another word.

Homebrew is thje battle ground for all those idea's.

We're the young generation and we got sum thing to say.

73 Old Timer,

de n8zu

I don't know about how other engineers from other cultures think about
schematics and how they should be drawn, though I suspect that they
are biased more by the idea that schematics are a whole different
"language" than their native written language.  Those engineers I have
known from cultures where the written language "goes" in a different
direction than mine still seem to draw schematics pretty much like I
do.

These days, I use computer programs to capture schematics, and they
```

support multiple page hierarchy. The result is that I try to keep functional blocks on the same "page," but the order of the pages is not necessarily consistent from one project to the next. The left-to-right flow on a page is strongly influenced by the fact that symbols for parts like transistors and amplifiers that have an "input" and an "output" all come in with the input on the left and the output on the right. I have to rotate or mirror the symbol to have it go the opposite direction. Sometimes I indeed do just that: for example, I'll draw a differential amplifier stage with one transistor in the native orientation, and the one to its right in the mirrored orientation.

I wonder if anyone would complain if I made a point of drawing a whole schematic package "backwards" with inputs on the right and outputs on the left... and maybe make things flow more from bottom to top...

Cheers,
Tom

For me, I draw schematics left to right mostly because I'm right-handed
and don't want my hand to smear the fresh ink or pencil lead across my
pretty picture :)

I would hope someone would mention it in your next design review. I have a couple of circuit books where the author spend a few pages mentioning how there is a marked difference in the understandability of schematics based on how they're drawn, particularly for things like differential pairs which, as you mentioned, people "expect" to be facing one another.

It seems like your employer decided that all power buttons should go on the lower-level corner of equipment as well!

Thanks. I have the needed files to modify the source code. The problem is I need the original Turbo Pascal source code. I know somebody that's coming here from the UK and there is a company there that sells a copy of the manual on disk with the source code, I hope, and will see if they can get me a copy before they leave.

The software executable itself I have. Its available from several sources on the 'net.

Hi!. I need to cover the HF and VHF ranges with as few VCOs as
possible. Think of this as the varactor version of the old general
purpose RF bench generators or grid-dip-meters. I know the penalties:
high phase noise, high drift, high harmonic content. I don't care,
this won't be made into a high dynamic range receiver.
What I do need is a reliable means to keep the peak-to-peak RF voltage
across the varactors (varicaps) below 1 or 0.5Vp-p. Otherwise, even
having back-to-back diodes they rectify the RF, create a DC component
into the 100k resistor that feeds the tuning voltage, and this
dramatically raises the bottom frequency. If I reduce the R, the f
goes lower, but the RF is nastily clipped by the diodes.
The oscillator is a FET Hartley (no Colpitts capacitive tap in order

to maximize C swing). All attempts I made on Spice and in real life to
AGC the amplitude always created a low frequency relaxation
oscillation.
Can anybody tell me about a proven way to accomplish this?. I have
already googled a little with no success.
Many thanks!

See if you can find any of the old (now) op-amp cook books or general
applications manuals. I saw one with a modified Wien-bridge that had an
AGC, but that was in 1975 for a breadboard I was doing.
Good luck.

Thanks Bill for your immediate answer!. Yes, RC oscillators have
impressive f spans: you change R or C by 10:1 and f changes 10:1, not
its square root. But... my needs go into the many hundreds MHz, sorry,
I have to stick to LC oscillators.

How elaborate an AGC loop are you trying? The _really pedantic_ way to
do it would be to use a separate amplitude detector, an op-amp controller
(which would let your controller be if not arbitrarily then at least
really really slow), and whatever bias point on the oscillator you're
changing to effect the gain.

This should let you get a pretty fancy transfer function on your
controller, to relieve the motor-boating.

Many hundreds of MHz? Are you trying for D.C. to daylight? I could poke
around a bit and see if I could trip over something while I look for
parts for my own projects. Are you looking to build or buy? It seems you
want a circuit to build. Am I on the right track? Some of the older ARRL
handbooks may have a circuit or two. Lately I have seen them migrating
towards VHF and UHF and higher frequency stuff.
Good luck.

A typical way of getting this kind of range is to use a pair of oscillators, at least one voltage controlled, a mixer, and a low pass filter -- with the amplitude stabilizing loop described previously.

Use a pair of YIG tuned oscillators and a wideband mixer, and you can get as wide a range as you want -- a lot of sweep generators work this way.

You could use a pair of Mini Circuits VCOs in the 2 to 4 GHz range and build a vco with a few hundred MHz range.

I remember what was known as a "seven league oscillator" which derived its name from the folklore of "seven league boots". The design was discussed in one of my old 1930's vintage vacuum tube books. If I remember correctly, one such oscillator covered from a few Hertz to several MHz. Unfortunately I am in SC and my library is back in Tennessee.

My memory may be wrong, but I think the book was "Functional Circuits and Oscillators" by Herbert Reich.

Hi Mark,
I looked over the thread that your note kicked off.
Unusually, this was not very informative.
People were sticking with antenna measures, which weren't helping much
in this case.

I'll give it a try, introducing the missing concept: energy (and
power) DENSITY.

If you sit in the bright sun for 2 hours, you are likely to get a sunburn.

If you sit in a dark tent, with an opening for a magnifying glass of 2
inch diameter (= 5 cm), you will get a small burn within 2 minutes.

Looking now at the numbers, you know that the effective power density
of the Sun at the surface is 700 watts per square meter. Your skin
represents say 1.5 sq meters, so you are getting a total power of say 1
kilowatt.
So we are suggesting, at a particular place it takes 1 kilowatt of solar
power for 2 hours to burn you all over.

Now lets look at that dark tent with a hole for a magnifying glass:

the power density at the glass is pi times 1 times 1 inches or pi X .025 X 0.025 square meters = 0.002 sq meters.
The Solar power at the glass is 700w X 0.002 m^2 = 1.4 watts

How the hell can 1.4 watts burn us in 2 minutes, but 1000 watts cannot burn us in less than 2 hours?

Answer power density:
That 1.4 watts is focussed on a spot that is 1 mm diameter (40 / 1000 inch diameter) so its power density is
1.4 / pi X 0.001 X 0.001 watts per sq meter

...and THAT is 446 kilowatts /sq meter.

Oh look: the power density of the spot in the dark tent is about SIXTY times as great as plain sunlight, so waddaya know, it burns us 60 times as fast (but only over a LITTLE spot.)

And that's what this thread was all about - the effects of focussing energy over a particular area.

I hope this helps.

A good read thank you.
A bit lengthy; but well done.
While illuminating the subject it does focus attention on the important point; the 'beaming' or directionalizing of the available energy, whether it be sunlight or any other frequency.
However there will always be some who 'can't' or 'won't' understand.
Witness some of the nonsense that is posted on various news groups all the time.
PS. That 700 watts per sq. metre is an interesting number? Bright sun at midday at the equator perhaps?
But I doubt that here at around 48 degrees north and with our climate we get anything close to that?
Also now wondering how efficient a solar panel is at converting that 700 watts into electric power (for say home use). Which may be why some 'solar' collectors are both photo-voltaic and heat collecting.

Thanks to a kind person who supplied me with Clevite catalog data
plus some other Clevite literature, I correctly identified my
Clevite TL-10D16A filter. It has a 455 KHz center-frequency,
-6 db bandwidth of 10 KHz, -60 db BW of 16 KHz. 1500 Ohms input
and output impedance. Insertion loss about 7 db. Data from
Clevite Bulletin 94012 dated Octover 1961. Bench testing shows
a fairly flat passband and very steep skirt attenuation. In a
couple of weeks I might have access to better instrumentation to
quantify its response characteristics.

Clevite was located at 232 Forbes Road, Bedford, Ohio, known in
Clevite Electronic Components, a division of Clevite Corporation,
Cleveland, Ohio. By 1969 they were at the same address and

known as "Gould Piezoelectric Division" with a zip code of 44146. Piezoelectic devices had been in production since 1959. Whether it was later acquired by a UK firm is unknown on what I have.

One of the interesting bits of information was a data sheet on Clevite "Identical Resonators" which contains 10 tables of ladder filter arrangements from 2 to 8 resonators as bandpass filters using only capacitors as coupling elements. That might be applicable to quartz crystal resonators.

73, Len AF6AY

Hi all,
I saw a site where a fellow designed a unit to measure impedance at 2.4 ghz, for use on wifi antennas. I don't recall if it was return loss or impedance.
It gave detailed instructions on how to build and he also had ready built units
for sale.
I think it was a ham that designed the unit. I also think he was not in the states, possibly a P or PY call sign, but the memory is not good!
Any help would be appreciated.
Thanks, Mike

A piece of Sage Wireline and a PCB to terminate it would be easier.

This is a copy of my reply to your duplicate posting to
alt.internet.wireless. Please don't do that again:

This one?
<http://pe2er.nl/wifiswr/index.htm>
or one of these:
<http://www.qsl.net/n9zia/wireless/appendixF.html>

What I do is use a return loss bridge as in:
<http://www.qsl.net/n9zia/wireless/pics/rtrn_loss_bridge.png>
I've built several out of chip resistors and junk parts. I have one
that works well up to about 8GHz. Great for testing antennas. That's
what's inside a Telonic Rho-tector (which can usually be found on eBay
for cheap). A few models go up to 2.4Ghz.

You'll also *might* need a microwave load or three. 50 ohms for a
reference, but also some other known values for calibration.

The problem is that you'll need an RF sweep generator to use this
effectively. It's also not a VNA (vector network analyzer) so it
won't tell you if any reactance is capacitive or inductive.

The scientific name for this measure is Solar Irradiance. If you hold up
a square frame 1 meter on a side, perpendicular to the Sun's direction,
in space near Earth's orbital distance, about 1400 watts passes the
frame - and twice as far from the Sun, that frame only frames a quarter
of that amount (of course!)

That number 700 W/m^2 takes into account the absorption of power by
stuff in the atmosphere, more at slant angles of course.

This URL can show the kind of Solar power you can expect at various
geographical coordinates.
http://re.jrc.ec.europa.eu/pvgis/apps/radday.php

You'll see a peak value around noon - and this can be more than 700
W/m^2 at that 48N latitude.

Brian W

Clever but I think the OP wanted test equipment, not tuning methods.
Also, I noticed that the markers were set to 2400.500 and 2900.500MHz
instead of US band limits of 2400.0 and 2483.5Mhz.

>So did the (plexiglas?) change the velocity factor for tuning.

The plastic raised the dielectric constant of the space between the patch and the ground plane. In effect, it increased the effective wavelength of the patch slightly, thus lowering its tuned frequency. You can (accidentally) get the same effect by tuning the antenna, and then placing it inside a PVC radome, which will also slower its tuning frequency. The author will probably find himself re-tuning the plastic piece after he's installed the patch antenna in an enclosure.

>Ya, I'll take his test equipment.
>   Mike

Build your own test equipment first. When that fails, mortgage the house, wife, kids, car, dog, cat, toys, etc and buy something better. However, beware of test equipment envy. Once you get on the test equipment upgrade path, nothing you own will be good enough, and there always will be something better.

This was a cool hamradio site, to my mind. I enjoyed the puzzle about
the unbalanced bridge current.   A clear simple description of Thevenin
versus Kirchoff.

Thanks

Brian W

Hey OM

If I look at the node of a source of 20mW and connect 10 wires to that node with equal loads, I will have 2mW going down each wire. No matter how I try and add them up I can't get more than 20 mW.

Now I take a 20 mW isotropic emitter, now your'e saying I feed a dish with that 20mW emitter through a feed horn and now all of a sudden I have gain, I have more than 20 mW? Because the dish and feed horn are able to add the particles and waves, where as with 10 wires I cannot add the waves and particles?

The only difference in both these are the shape of the dish and the medium used to convey the wave, particles.
And you can add the waves particles until you run out of dish.

Actually your example tends to prove the point that you're questioning.
  10 points of 2mw DO add up to 20 mw.

The difference with an isotropic radiator is that there are an infinite
number of points each at say 20mw.  Add 'em up by focusing those points
into a single path.

If you can rationalize a 20mw transmitter feeding one direction down a
feedline or waveguide and still getting 20mw EIRP in ALL directions with
an isotropic radiator then it should make sense.

-Bill

Correct.

Not exactly, I am saying you have a gain in power DENSITY
i.e watts per sq meter.   In a desired direction only, naturally.

Like when you use a magnifying glass to collect the Sun's power into a
small spot.

I'm trying to model an FM transmitter with LTspice. The schematic of the circuit I'm trying to model is shown here:

http://www.sentex.ca/~mec1995/circ/fmt1.htm

It takes a while to start oscillating, but when it does reach a steady oscillation, the lower half of the waveforms look a little distorted. Interestingly, when I reduce the inductor value (to say .01uH), the waveforms are less distorted, but when I only decrease the capacitor (to say 3pF), the waveforms become more distorted. Any insight into the source of this distortion?

Could it be that I need to model an equivalent antenna?

I've copied the LTspice .asc file below.

Thanks in advance!
Dave

What are you trying to find out with your simulation? Simulation is
usually either pointless or time consuming unless you have some narrow
thing to look for, and have a good idea what it is.

I suspect that the waveform distortion is related to the impedance of the
tank more than the resonant frequency. Reducing the inductor value
lowers impedance and raises frequency; reducing the capacitor value
raises impedance and frequency together.

Yes, you probably need to model an equivalent antenna. In fact, for many
things you may want to find out from simulation you would need to model
several different equivalent antennas.

In order to start, an oscillator has a loop gain greater than one. This causes the oscillation amplitude to continually increase. Eventually, the amplitude is limited by something nonlinear, since it can't increase forever. Oscillators designed for low noise, high stability, or other precise characteristics have some stable limiting mechanism such as diodes to limit the amplitude at a known value. Most, like this one, depend on distortion caused by overdriving one or both transistors to limit the amplitude. Consequently, distortion virtually always occurs(*). To get a clean output requires filtering, and the more distortion in the basic feedback waveform, the better the filtering required. All this circuit has is a single tank circuit in one transistor collector. The loaded Q of this circuit is just too low and the fundamental distortion too great to get a clean waveform. Adding an antenna might help or hurt the distortion, depending on the type of antenna -- it might filter some harmonics but not others, and at resonance it'll further load the tank. You might try tapping the collector and antenna down on the tank, but I'd be prone to add some additional filtering between the tank and antenna. Even that might not work as you expect because of the complex way the antenna impedance changes with frequency, but it'll help.

(*) It's usually not practical to filter audio oscillators, so some low distortion audio oscillators are made by using feedback limiting that has a very slow time constant -- one that's many cycles of the waveform. A light bulb is often used for the limiter. In general, you can trade loop gain for distortion -- the closer you make the loop gain in the linear region to 1, the less distortion you get. But the slower it starts, and it won't start at all if anything like temperature or component value variation drops the loop gain below 1.

Roy Lewallen, W7EL

Whoever said to expect something like a clean signal from a
transmitter like that in the first place. I ve build a few of those
little toy FM transmitters and the output is far from clean. Unless
this is just an exercise in Spice modeling
its probably a waste of time to do so. Intead of worrying about the
antenna I would try to figure out what was the best load for the
circuit and design an antenna to meet that requirement otherwise I
would just hang a 8 inch piece of hookup wire off it aand call it
done.

Jimmie

I ran the file. It looks like the output voltage is forward biasing the collector-base junction of the output transistor Q2 , causing some clipping. Q2 is saturating.

I was going to suggest that if he wants a clean signal he should probably
filter the snot out of the signal, and maybe even buffer it.

But he didn't ask...

That would be my guess too....I suspect you have set the output tuned circuit Q way high. Tapping the antenna into the coil might serve you better, and placing a small resistor in the emitter path before the feedback cap would hold the gain down, but planting a resistor to represent the antenna load might do the trick right there??

```

Hi
I have the Delhi selfsupporting tower, it is 48ft tall I believe, an old ham tower. It has the top piece plate but I need the plate that is about 5 ft down. The previous owner of the tower made some home made ones for each 1/3 length of the tower but now I need the replacement for the one plate that I can connect the angle brackets that hold the u bolts that hold the masting. I went to to a local tv distributor now who sells the tower but not the replacement parts. I also need those angle brackets. I am in Southern Ontario. Any ideas where there are shops or ham fests in this area soon?

Thanks

```

I think they make the Delhi towers.

-Bill

Hey OM:

I tell you what. I took just 1 particle wave and shoot the particle wave into a 60db dish. At the focus I got 1,000,000 partivle waves. I mean that is 60 db right?

So where did the other 999,999 particles come from? Energy density from focusing just one particle?

The two slot experiment buttresses the above.

Take 2 parallel slots shoot just one particle wave into just one slot and 2 particle waves come out the other side.

73 OM
de n8zu

Take a small light bulb, it shines light in many directions.

Place this at the focal point of a mirrored parabolic dish and the
light is predominantly directed in one direction.

In the direction that the dish is pointing, and at a distance, measure
the received light using a light meter.

Remove the dish, and at the same distance, measure the received light
using a light meter from the naked bulb.

One measurement will be higher than the other.

Why do you think this might be ?

Yes.

NOW, you're getting it! No more particles, but more particle density,
when the flux is directed tightly...

Actually no.   But you probably realized that. Or did you?

I am not pursuing this much further, because you are starting to respond
like a person who wants to drag out an argument.

Listen to me when I say: "I can be wrong. I often am."

Can you say that too, with some sincerity?   :-)

Brian W

Nice concrete example, Mark.
The same conclusion holds if the bulb is so dim, that it only emits one
photon at intervals.

Hey OM

By golly ole timer you hit the nail on the head.

I don't pay no stinking taxes, in the W-4 form I put "EXEMPT" where it
asks for number of deductions, and when I file my 1040 it says at the
end of the form REFUND DUE, in four figures, for the last several
years. Now that is legit, but it sure is WRONG, at least that is what
everyone tells me.

Your trouble is you pay taxes, where as I don't. Now that is energy
density.

Yep, this is an off-the-wall question.....

Paging through an old QST, it dawned on me that when schematics are drawn, usually the earliest stages are drawn on the left side of the diagram. The
speech input circuits for a voice transmitter; the antenna coupling and RF preamp (if any) for a receiver, etc., all seem to be drawn on the left.

In the tube days at least (and to some degree with solid-state homebrew today) we

seem to build the actual equipment the same way: the earliest stages
are physically on the left side of the gear.

Of course, in Western culture we also read and write from left to right. I
suppose we learn to look for the beginning of a story on the left side of
the page.

And of course, in some other cultures, people read and write from *right to left*.

When people from these cultures become involved in radio, do they draw schematics
(and build gear?) in the same direction Westerners do? Or do they
work "backwards"?

I've always wondered why some languages were written from right to left.
Could it be that in some cultures left handed people were more common
than right handed?

Actually, I think the answer lies in the fact that some early writing
was done not on paper like material with charcoal or ink, but with stone
tablets and chisels. Since a right handed person would hold the chisel
with his left hand to strike it with a hammer held in his right, the
characters would be written from right to left. So ancient languages
like Hebrew would have been written from right to left, and still are
even though nothing is carved in stone anymore.

While Hebrew words are written right to left, in Israel, numbers are not.

Dates are the European format, dd/mm/yy. Telephone numbers used to be six digits 123-456 and they went to 7 digits a digit was added at the begining, so the they became 1234-567.

Did pre WWII schematics in China and Japan go right to left? I know that Japan had a thriving electronics industry and university level studies.

Geoff.

Some old scripts used bidirectional writing, with one line going from
left to right and the next right to left
http://en.wikipedia.org/wiki/Boustrophedon

Some schematics appears to be drawn in this way too.

Paul

HI,
I'm building the ADC-40 made by KD1JV.
I would like to know what kind of 10.7 FI is used as filter because there are several type of FI with different characteristics spotted by different color.

Could someone tell me the color I need ?

Thanks a lot.

Here the link of ADC-40 : http://kd1jv.qrpradio.com/ADC/ADC-40.htm

Re telephone numbers. Historically smaller telephone systems had
various numbers of digits! Sometimes as few as three digits.
In large cities such as New York, London, early systems used letters
not digits to identify the switching centre. So an operator would be
asked "Get me Yonkers 2348" etc.
A famous telephone number was WHI-1212 (Namely; Whitehall one two one
two, for Scotland Yard, UK's federal police at the time).
With introduction of long distance dialling it then became was
necessary to have other WHn telephone switching exchanges. Lets' say
there was a WHITCHURCH for example. WHI could not be use for both! So
WH2 and then WH3 were used.
Eventually using letters became too cumbersome and switching offices
(in North America at least) became "All number".
For example I live in an area where the switching office code is 437-.
It's a small area and not all the possible numbers within 437- are
used. However with today's portability of numbers and computer
directed switching the concept of a switching exchange serving only
one geographic area has completely changed.
The concept of three digits identifying a switching unit within which

one could have ten thousand individual telephone subscriber numbers 0000 to 9999, along with three digit 'Area Codes' for the various provinces, cities and states in North America also worked well and is in use today. Heavily populated areas have several (many) area codes. While lightly populated ones may not use more than a small percentage of the theoretically possible one million combinations within each area code.

He says he used a Mouser 42IF123 "green" IF transformer but he notes
that 42IF122 "brown" works too. It's there primarily to be a easy 7
MHz resonant circuit although the impedance transformation is a useful

side effect here.

Thanks a lot Tim.
But it is amazing because the two FI have very different impedances :
42IF122 = 15K/0.3K
42IF123 = 25K/4K
Which are rather distant from one another...

OK I will try

I think the objective of the 10.7 MHz IF transformers here is their ability to be retuned to resonate in the 40M band (7000-7300 KHz). The actual impedances aren't critical as long as 40M resonance can be achieved.

KD1JV is using them as readily available components that can be made to resonate on 40M.

That section is both a narrowband filter and a matching network; the topology around two coupled resonant LC's guarantees the narrowbandedness more than any individual component values. And mismatches can largely be accomodated by tweaking the cores. I'm sure there's some difference in core position depending on what part you use but as long as it peaks up in the 40M band you're good to go.

If you don't have those Mouser cores, don't worry, you can tear apart any FM radio from the past chunk of a century and find 10.7MHz transformers in it.

Tim.

In the 70's I was befuddled by a bunch of schematics from England that
I had to decode. I came to the conclusion that they were hard to read
because they drive on the wrong side of the road over there. But
really they were just using (by my standards) some odd symbols or odd
line thicknesses oddly placed. In my experience the choice of odd or
unconventional or even just different symbols is a far bigger barrier
to schematics between different cultures than any left-to-right bias.

Tim.

=========================================
The above reference leads to a very interesting 'general electronics'
home brew site .

Thanks

Frank   GM0CSZ / KN6WH

Hi Paul,

> This board is for those who enjoy the art of putting together electronic
> things by hand.

So where foes the homebrewing come in?

> I wish I was allow to drink, not religious reasons but docs orders :~(
> Can you make/convert those recipes non alcoholic???

Not really, but a nice wine (12-15%) blended with soda water,
lemon and ice is very pleasant, especially by the pool on these
hot sunny days. The alcohol content is so low (4 - 6%) that
it is like taking a beer, but in smaller quantities.

Johan Binn Chardonay is quite strong in flavour, but only 8.5%
alcohol, which means the drink will have as much alcohol as a
very weak beer.

The tase, however, is like a sparkling wine. Best of both worlds?
Or is that still too much for your doctor?

Regards Eddie

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

Hey OM:

From one of my fav sources wiki pedia:
"Carrier pigeons historically carried messages only one way, to their
home."

So if you're mobile you can forget two way communication.
The pigeon sent from your base would never find you in your mobile.

73 OM
de n8zu

It's metaphorical, I suppose. On the other hand, brewing beer appeals to me in much the same way that homebrew electronics does. I only have space for so many hobbies, though.

Anyway, if you're looking for the drinkable stuff, check out the rec.crafts.brewing group. I don't know how active it is, but a quick glance looks like there's some discussion going on.

There's also alt.beer.home-brewing, rec.crafts.distilling, rec.crafts.winemaking, and rec.crafts.meadmaking. Same caveats. :)

[Previously sent to rec.radio.amateur.equipment by mistake... resent here]

Hi all,

I was wondering if anyone knew of a solid state 2m linear amp project that I could build. I'm looking for no more than about 30W. It'll be primarily used for FM, driven from my handheld radio. Bonus points if it can do 70cm too (or at least allow pass-through unattenuated...).

Most of the designs I've seen are for tubes with an output power in the KW-range... my radio license only allows me to transmit 30W FM or 100W SSB... so these are massive overkill (and not desirable for other reasons).

The only project I've seen that fits the bill so far is http://www.falara.org/tektalk/GPOAmp.html which calls for a PCB made with G10 stock. I have no idea where to obtain that here in Brisbane, I have some blank PCB, but have no idea what grade it is, or how much impact on performance using it would have. The MRF1946A is also difficult to source.

Does anyone know of a good project to start on this sort of thing?

Regards,
Stuart Longland (VK4MSL)

You can homebrew a very simple amp that should meet your specifications...

A generic PC board can be found at http://www.rfparts.com/pcb.html and I would recommend part number DEM2330. There is a link to "View a pdf of the DEM2330 Instruction Sheet." You could build everything as they show in the instruction sheet (which is for a 1300 MHz amp) and just substitute the RF module with the Mitsubishi RA30H1317M module for 2M or the RA30H4045MR for 70cm. The data sheets for the modules are at http://www.rfparts.com/module_sau-sav.html#ra and there are also more module choices there. Both modules specify an input power of 50 mW maximum, so you would need an attenuator (pi type is easily done by cutting a break in the input lead on the circuit board and installing the correct resistors around the cut). If you have 1.5W from the HT, you would need about 16 dB of attenuation. You would need a pair of RF relays, one at the input and one at the output to route TX signals through the amp on TX and bypass around the amp during RX.

Good luck with the project!

73,
Scott

Does anybody have a link to a scan of an old data sheet for the 811 (NOT
811A) tube? All I seem to find are 811A spec's. I have the two line
blub on the older 811 in an old ARRL HB, but I'd like to get the
complete spec sheet. This tube existed in the gap between the TT3 and
TT4 tube manuals so I can't find it.

Ahh right... I had a look around, looks like Minikits[1] sell the
power modules (and even a PCB).  This looks promising.

> =A0Both modules specify an input power of 50 mW

The handheld can be wound right back to 50mW when running off
batteries... otherwise 0.5W. A pi network isn't hard though. That
said... I won't make the mistake I made last time -- last time I tried
making it with 5W wire wound resistors... and wondered why it didn't
work.

I shall do some further investigation.

Thanks.

Thanks, but that's NOT it.
   This link goes to the Svetlana sv811-10 which is NOT the same as the
ORIGINAL RCA 811 transmitting tube. Svetlana had no right to call this
bottle an 811 as it does NOT have the plate cap, is NOT a transmitting
tube, and has a mu of 10 not 160!
This is a nice AUDIO tube, more of a replacement for the 300B than an 811!

I don't know where to find the datasheet for the 811-non-A, but I did
want to step in and point out that TT3 has the BEST TUBE PORN EVER!.
That picture of the 833 gets me all excited, even today.

Tim.

Actually, the 811 was sold by RCA as the "audio tube"; they sold the
similar but not identical 812 as the RF tube. The beauty of the 811 as
a push-pull class B modulator is the low parts count and you don't
need any bias supply.

It was only in the 1950's with the advent of SSB that the simplicity
and excellent characteristics of the zero bias triode became clear in
RF linear amplifier service. Before that everyone ran all their RF
stages in class C for efficiency. It was the 30L1 in 1960, and some
hams experimenting with zero bias in the 50's, that placed the 811A in
the RF tube category. RCA of course was more than happy to sell the
tubes for whatever purpose :-).

Oh, here's a 811 (non-A) datasheet from HB3:
http://www.pmillett.com/tubedata/HB-3/Transmitting_Tubes/811.pdf

Good reading that mentions 811 marketing, and the advent of zero bias
triodes for SSB linears, is in the 1996 QST article: "811A:
Grandfather of the zero bias revolution". It notes that the main
difference between the 811A and the non-A, was the addition of extra
fin area in the 811A to boost dissipation.
```

Maybe with some more searching you can find PCBs that include the tx/rx
switching, preferably with PIN diodes. That will save you a lot of
money and construction effort.
(with a bare amplifier PCB as shown on that site, you will need relays
and a circuit to drive them when transmitting, in addition to the
amplifier PCB)

> The handheld can be wound right back to 50mW when running off

It is better not to rely solely on lowpower settings of the handheld,
as sooner or later you'll forget to set it to lowpower, it will drive
5W into the module, and destroy it.
So it is best to have some attenuation in front of the module, such that
it will survive accidental input of the full power of the handheld.

You can then still use lower power in normal use, so the handheld will not run too hot. Find the maximum allowable input power for the module and design the pi network so it will attenuate the highest output power of the handheld sufficiently. Then calculate the nominal power to the module (for driving it to e.g. 90% of its max output) and use the handheld at that power level.   That could be 0.5 W or so.

Stuart,

Unless you absolutely want the experience of building, you may (I don't know the situation in Australia) be able to find a used mobile 2m or 2m/70cm tranceiver for a reasonable price. My used Yaesu FT-2800M cost me 100 Canadian dollars. I had been thinking of buying an amp for my HT but discovered it is easier to simply buy a transceiver that gives me 25 watts along with 3 other power choices.

I hope the suggestion helps.

Yes, and the transceiver will give you an additional advantage over your handheld - better dynamic range on receive because the filtering is better because there's more space for good filters.
73,
Bob AD3K

Oh how boring (correct, but boring).

If one were very clever one may be able to make the last leg of the
attenuator a pair of back-to-back diodes that would clip at a moderately
low level, protecting the module while still allowing it to work when you
_do_ set the radio to low power.

I'd have to work through the details to see if it's feasible, but it sure
sounds cool.

I don't think it is a good idea to have a signal clipped by diodes,
then amplified by a wideband amplifier and fed into a transmitting antenna.
But hey, to each his likings!

You mean like a pin diode attenuator controlled by a sort of ALC? ;)

I don't know where to find the datasheet for the 811-non-A, but I did
want to step in and point out that TT3 has the BEST SHEMALE TUBE PORN EVER!.
That picture of the 833 gets me all excited, even today.

Thanks! That's the one.
While it is true that the 811 was originally intended for use as an
audio tube in modulators RCA also published spec's on using it as an RF
final. May hams used the same tube type in both places so as to only
keep one tube type for spares. Audiophools today probably search for
812's for use in single ended class A amps.

Does anybody have a link or a scanned copy of the old RCA COS/MOS Integrated Circuit databook for the CD4000A/B series logic chips? I have a whole collection of datasheets for the various chips but I would like to get a copy of the original databook in a machine readable format, PDF or Postscript would be OK. I let a coworker use my copy and somebody stole it off his desk.

This is the ultimate aim... will be to purchase a newer radio. I have
my eyes set on a FT-897D, but it'll require quite some saving to
acquire the necessary cash.

I would still like to homebrew a linear amp though, as the final stage
for homebrew transceivers. This would be something that I'd be
looking to do in order to improve my understanding of
radiocommunications.

I'm also aware that I need not use a linear amp for FM (or CW/PSK,
class-C amps work for these modes), but since the homebrewing
mentioned above may also include AM and SSB, I figure a linear is
going to give me much better flexibility.

Well... there are those who just like drinking alcohol all day,
listening to the radio.  There's a certain satisfaction one gets
though, when you've used some mental muscle and elbow grease to home-
manufacture the radio receiver (or transceiver) yourself from basic
components.

There's also a nice feeling when your home brew of alcohol works out
just the way you like it.

Put these two things together... life is good. :-)

Regards,
Stuart Longland (VK4MSL)

Before considering a RF power amplifier for SSB operation ,get the best possible antenna(s) for the relevant bands .
These will give you even better fexibility .

Do you known about good articles (or books) about the design of frequency multiplicator stages using tubes ?

I want to learn about choosing the operation point and the optimal load, in order to get a good efficiency and a good output power while reminding in the allowed limits.

Thanks a lot !

Claude

Clarke and Hess, "Communications Circuits Analysis and Design", is a good book about operating points and goes into the math of figuring out what harmonics are produced at an operating point and drive. They also have a very good analysis of mixers. The math isn't heavyweight but is definitely college-level requiring application of calculus and it doesn't hurt to understand Laplace transforms either.

Today you'd probably do a SPICE simulation instead of the Taylor series expansions that Clarke and Hess go through, but it's still very worthwhile to understand what operating point parameters do in terms

of harmonics and the book gives insight that simply running
simulations won't give you.

In the ham cookbook sense, it is more common to copy a circuit out of
a handbook, build it and crank up the input power until you either get
the efficiency you expect, or you add another stage to get the power
you need. Both the ARRL handbook and Experimental Methods in RF Design
go into the sorts of efficiencies expected from different designs.

Most tube multipliers are simply operated in deep class C, with more
saturation than might be done for an efficient RF amp.

I have the 1977 'cmos/mos integrated circuits' book
and the 1983 'cmos integrated circuits' book.

The 1977 book seems in better shape as it might have
been printed on acid free paper. The newer book is
turning brown, but is still in readable shape.

Lot's of pages, would take too much time to scan it all.
Anything in particular that you need?

Kenneth;

Thanks for the offer. I was looking for a complete replacement version in a
machine readable format. The person I let use my work copy, and somebody it
ripped off from him, was working on a hobby project during his break time;
it was absolutely nothing work related.

73's

Leland C. Scott

Yup: I made/home-built/constructed/home-brewed, or whatever terms we
want to use, my first radio at around age 13 a few years following
WWII.
That led to a 40 year career in telecomms. Still tinkering! But
haven't built anything new for years.
Sorry but only 'consumption' here, by choice, is a half glass of wine
(not even home-brewed!) with a meal; when offered.
Mash on chaps! Best of luck.

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

There are graphs for input IP3, compression and gain in
the Philips data-sheet. The exact value of IP3 will
depend on the supply voltage, frequency and the configuration
of your circuit. The data-sheet figure for 45MHz is -13dBm.
You will want the IF input to be well below this level.
Somewhere in the -25 to -40dBm region should be ok.

The xx612 is a low power, high gain device. It is not a
particularly good choice as a product detector in a superhet.
A simple two diode balanced mixer or a diode ring mixer (DBM)
would give much better IMD performance and costs even less than
the 612.

73, Ed. EI9GQ.

Thank you very much for your reply. I'm going to use NE612 because it's quite popular and easy to use. Double balanced mixers are better, but they need vary good impedance matching and high LO signal level. I don't have much experience in building RF circuits, but I think the IMD performance is not as important in product detector, as in the first mixer.

My concept of the receiver stage is that: bandpass filters -> variable attenuators -> first mixer AD831 -> quarz filter XF9/B (a polish replacement) with 9MHz IF -> IF block based on variable gain amplifiers LMH6505 and preamplifier LMH6624 -> product detector.

I would use AD831 also as a product detector but this part is very hard to find in Poland so I only managed to get one piece.

PS. I have read your webpage that helped me much in building my own transceiver!

Not intended to be a high-level input device, the Gilbert Cell
structure of the
SA612 or SA612A should make a good, low-power SSB or CW detector.
Mixer ratings put the IP3 maximum at -15 dbm which comes out to about
40 mV p-p at the input. Mixer conversion gain is somewhere in between
14
and 19 db.

Both input and output impedances are 1.5 KOhms in parallel with about
2 pFd. Both inputs are DC biased internally so capacitive coupling
should
be used (very important so as not to disturb internal biasing).
Output
impedance is 1.5 KOhms from the internal collector loads, should also

be capacitively-coupled to the audio output. Expect an audio output level to be about 1 V peak-to-peak maximum with an IF input of ~ 40 mV peak-to-peak. That is running from a +5 VDC supply rail. It is almost the same with a +6 VDC supply rail.

Carrier re-insertion/mixing (for "product detector" use) would be about 200 to 300 mV peak-to-peak. Try not to exceed 300 mV p-p as that will cause distortion from "BFO" harmonic generation. Dropping below 200 mV p-p will cause the conversion transconductance to drop until it almost disappears.

Interesting application, breaking some new territory there! :-) Basically an HF to low-UHF design, it was intended solely as a low-supply-drain (2.4 to 3.0 mA) front-end mixer, it should work equally well to "down-mix" back to audio range. Mixing is mixing, dependent only on the frequency response of the internal transistor junctions.

73,
Len Anderson AF6AY

Actually the SA602/612 (IIRC the '602 is the better part, the 612 is a fallout of 602's that didn't meet spec) can work well. The Elecraft K2 uses this chip in several places, including the product detector and the K2 has one of the best receiver spec's out there. They did make use of pads in the signal and hfo paths to get the input levels correct, and no doubt matched input and output impedances correctly as well. An inspection of the K2 schematic's would be a good lesson in setting up this part.

I did this a long time ago with an NE602, in a receiver with audio-derived AGC (see http://www.wescottdesign.com/articles/MSK/page_79.html). With IF input levels the mixer would suffer diminishing output. This would cause the AGC to get "stuck" in a positive feedback mode and push the thing to ever-higher gain and ever-lower audio levels. I fixed it with a pair of diodes, one in each direction, at the IF input to the mixer (they're not in the schematic). They'd distort the signal at those levels, but at that point it was much higher than desired anyway -- it just needed to keep it low enough to let the AGC grab hold.

I _think_ they were germanium diodes -- IIRC silicon diodes let too much signal through. You could use germanium, Schottky, or plain old silicon diodes plus a 6dB pad, all to equal effect.

I'd tell you how good it sounded, but it was a data-link receiver and I don't recall ever listening to it!

Hi gang,
Anyone know of an sites of folks doing homebrew HD radio demods? There are several sites out there for doing shortwave DRM (Digital Radio Mondale), but I'm wondering if any efforts have been made to build similar hardware/software for the HD radio broadcasting that takes place on the U.S AM broadcast band.

Haven't heard of any.

Unlike DRM, HD Radio is a proprietary protocol, I don't *think* they release enough details to implement it unless you're a chipmaker who's paid the royalties.

(I suppose one could reverse-engineer it -- to my knowledge there is no encryption involved)

22AWG stranded,silver plated, teflon insulated wire in 100 foot lengths.
package of 500 feet (five rolls) $26 shipped if paid by paypal.

save on shipping with two packs (1000' total = $47 shipped if paid by paypal)

The wire is packed and is in an assortment of colors. No choices of specific colors. The silver plating make soldering easy. It won't shrink and is rated for 600V and 200 degrees C. Some have used it in homebrew radios.amplifiers, tube radios, portable antennas etc.

I decided the IF amplifier will deliver the signal to SA612 at the level -40dBm. Thanks everyone for advices.

Hey OM:

I would suspect that the FCC knows everything there is to know about
AM broadcast band HD. They sure did go thru extensive testing to get
HD on that band.
Towit: the FCC has to know what is going on and how they is doing the
goings ons.

BTW ya all know that the HD in HD radio does NOT stand for 'high def'.
(It means "hybrid digital").

Archive-name: radio/ham-radio/recruitment
Revision: 1.1 2007/09/29 18:42:47
Posting-Frequency: posted monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been
recently revived by an active moderation team. We are currently seeking
suitable information, FAQ, and bulletin articles from the entire

rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

```
 radio/personal-intro
 Subject: Guide to the rec.radio Newsgroups
 Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
 Last Posted: 9 Nov 2001 06:18:17 GMT
 Posting-Frequency: 15th of each month
```

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to rec-radio-info-request@panix.com.

```

> Thanks in advance :-D

The model number ARC-5 actually refers to a series of equipment designed for use in aircraft in the late 30's and into the 40's and 50's. This equipment consisted of a series of single band receivers and transmitters, modulators, and control boxes. Most of the units covered the frequency range from 3-9 mhz, some lower frequency units went down to 1.5 mhz, and some of the receivers went down as far as 190khz. There were also transmitters and receivers for the 100-150mhz region, but these used a different design.

The MF and HF receivers had a tube lineup of 12SK7 rf and if, 12K8 converter, 12SR7 detector/bfo, 12A6 af output. Some sets used a 12SF7 in the final IF/detector. The transmitters used 1626 oscillators driving 1625 finals, a 1629 eye tube was used as a frequency reference with a crystal. The VHF receivers used 9000 series tubes in the front end, the VHF transmitters used 1625's and 832's. Both single and dual tube modulators were made using 1625's.

A later series of ARC-5 type equipment used Loktal tubes. The receivers in these did NOT have BFO oscillators as they were used only for AM phone reception.

There were slight differences between the Navy and Army/Aircor units.

After the end of WWII and the Korean war the government surplus'ed large numbers of this equipment. Hams quickly found them to be a good resource for parts, and also used them 'as is' or modified. Today these units still show up at hamfest flea markets. Unmodified near mint condition ARC-5 units can easily fetch near or over $100 each on Eaybay these days, but you can still find units in much worse condition suitable for parts or experimenting with for much less. The newer sets using Loktal tubes were not made in as large numbers as the older ones, but they were quite plentiful in recent years. These sets are not in as much demand as the older 'classic' units.

If your ARC-5 radios are in near mint condition you might give any of the groups that restore WWII era planes a call. The Confederate Air Force comes to mind.

Oops, I think you meant COMMEMORATIVE Air Force (due to "political
correctness" B.S.)...I do agree...these were used in WWII planes such as
the B-17 (if I recall correctly) so there is historical value if nothing
else...

Hi

I have a 50 ft tower just ready to throw up something to operate.

Cost is the problem but I have a lot of parts to build. I want to put up a
dipole (I have a manual all band tuner) and my question is should feed it
with ladder line or feed it with coax and then run each leg about 68 ft .

Second idea is I have an old aluminum omni antenna that used to have 3 traps
within it, however at that height it will come down quickly as this antenna
is meant to be on the ground (no ground planes) so I want to make this omni
as long as practically possible and tune it to utilize it as best possible.

Any suggestions? This is really all I have to work with. Only want to climb
this thing a couple times and hope its good for the winter.

Thanks
73s

Ron

A commercially built Yagi will usually work out of the box on a tower if you
measure carefully.  A G5RV will work without much fiddling.  The vertical
won't be worth anything on the tower.  If you want to shunt feed the tower
and extend it another 17 ft. you could probably do well on 40 and 30 meters
in the wee hours of the morning.  You should post in RRA Antenna newsgroup,
as there are experts who will have a lot of detail and time on their hands
and are fun to watch bicker.

Guys,

I figured it out by myself.  Audacity is the software I can use to do
my project.
TU,
KB2AMY

I like that too.  Just record some real QSO off the air.

While putting a vertical on a tower seems a waste of a tower, verticals

DO work better on a tower if they are of the half wave length center feed kind, such as the GAP Titan. I have mine on a short tower against the house so that the base of the antenna is just above the roof line. The antenna is on a tilt over mount so I can lower against the roof whenever a tropical cyclone blows through here. The antenna works better up 25 feet than ground mounted (and the kids can't trip over it in the back yard).

A 4btv trap vertical or the like would be a different matter, requiring some fiddling. A Yagi and (or) G5RV would require a minimum of fiddling. A ladder line fed homemade G5RV in inverted vee would be the least expensive I could think of. A used 3 element Yagis can be cleaned up and re-used later..

The trap vertical that was mentioned would probably be a real hassle to tune-up on the tower.

The GAP Titan can be dumped out of the box, assembled (use a tape measure to get everything as per the manual) and put up without ANY fooling around. You *MIGHT* have to make a minor adjustment to get the 80 and 40 meter bands right with the lowest SWR centered in the middle of the band segment that you operate most, but mine came out perfect using the factory directions.

You are telling me that the measurements are the same for tower mounting?

I have the following General Radio equipment for sale. All of it is in very good condition and working:

The following items I would like to sell as a set:

1	874-LB	55 cm Slotted Line
1	874-LV	Micrometer for the slotted line
2	874-LTL	Trombone lines
1	874-GA	Adjustable Attenuator
1	874-L30	30 cm Air Line
3	874-L20	20 cm Air Lines
4	874-L10	10 cm Air Lines
1	874-F1000	1000 MHz Low Pass Filter
1	874-L500	500 MHz Low Pass Filter
1	874-D50	50 cm Adjustable Stub
1	874-D50L	50 cm Adjustable Stub
1	874-D20	20 cm Adjustable Stub
2	874-LA	Adjustable Line

```
5    874-T        Tee's
1    874-EL        Elbow
2    874-K        Coupling Capacitors
5    Small diameter cables with GR conn.'s on both ends
2    Small diameter cables with GR conn. on one end and BNC on other
1    Small diameter cable with GR conn. on one end and banana plugs on
other
5    Large diameter cables with GR conn. on both ends
```

I will accept any reasonable offer plus postage. I can send pictures
if requested.

I can be reached at either wa0goz@arrl.net or 651-426-4144. Ask for
Henry.

```

Thank you kindly for all the info

I have a lot of wire, can make any dipole, I have this 50ft tower that I want to make a dipole and omni on the top.

The omni I want to be tunable so I can use it on other bands such as marine band, to communicate with my boat

I have the manual tuner with reflected power measurements, so that is ok. I want to know what is better, the dipole fed with coax or fed with ladder line. The coax will run out the house, past the alumninum siding and be taped to the tower, the ladder line I can run out the house, past the same aluminum siding but can keep away from the tower about 4 feet until it reaches the top where the dipole will split it and run the longest length I can (I have the room) so that I can utilize all the bands with my tuner.

All suggestions and advice are excellent and I hope to hear and learn more

thanks

73

A fan dipole has multiple dipoles with the same feed using spreader insulators at the end of each shorter dipole. Full size 40 meter dipole usually works on 15 with a tuner as it is not far from a 3/4 wave, and 80 might work on 10.   I always wanted a full size cage dipole for 80 and 75. This has several wires for broad band operation.   HF Discone is another interesting broadband antenna. You could use the tower as a support but takes up some space.

Good luck

I have a single tree in the middle at my site and I use it as the feedpoint for an inverted-V antenna. Each segment is about 20 m long from the feed point for 3.5 MHz operation. Also there are two 10 m segments in different directions for 7 (and 21 MHz). There are some ferrite toroids on the coax close to the feed point as a current balun.

I also experimented with two 5 m segments from the same feed point into slightly different directions for 14 MHz operation. Unfortunately, it was quite hard to find the suitable length for these segments using any SWR measurements and by using a noise bridge, I had to extend the segments with nearly a meter, in order to get the SWR down to operate without a tuner. Of course this varies from site to site.

Hi I am building a (240volt in) 13.8 volt (out) PSU along the lines of this plan..
http://www.warc.org.uk/proj_psu.php it is very similar to the old Marchwood practical wireless unit from the early 1980's using 2n3055 transistors.

My question. The spec says the transformer must have a secondary of 16.5 volt. Now when I last built a PSU using a similar plan the transformer output could be much higher, in the region of 15 to 20 volts.

I have a Talema branded toroid I want to use, its spec is as follows (from maker)
+++++
Toroidal transformer type 5028-P3S03:
Prim: 0-110V-230V-240V orange-yellow-violet-blue
Sec1: 20V/6A green-red
Sec2: 20V/6A black-white

Sec3: 55V/2,5A braun-braun
If you use only the 2x20V you can get out 9A of each winding (no load on the 55V)
+++++

as you can see the secondary output is 20 volt, now folks do you think this transformer will suffice at 20 volts, or should I removed a little winding to bring it down?

73 Andy

PS the variac is just there for scale.

By using it the way it is your only design worry is that you will be dumping more power across the 2N3055 Regulator Transistors, and will need more of them, for the same current output, due to Dissipation Limits of the heatsinks and transistor cases, because of the higher Voltage Drop across the regulators. Also recognise that you will have a much higher DC Voltage going into the regulators, after some Capacitor Filtering. Likely up near 25 Vdc, which means you will be dumping roughly 50% of the provided transformer power in the Regulation System.

If you _really_ want to do some work you could remove all the secondary windings and replace them with a single 16V winding; that'll give you 25% more current just from the drop to 16V from 20V, plus whatever extra power you can take because you used the space formerly taken up by the 55V winding to put in bigger wire.

Lots -o- work, though.

The transformer will work in the project that you are looking at, however, the pass transistors will run significantly hotter than if you used the transformer voltage specified.   Your transformer will produce about 28VDC after the rectifier/filter. The pass transistors must drop the difference between 28 VDC and the output voltage (13.8VDC), which is roughly 14 VDC. Multiply that by the output current to get the power that the pass transistors must dissipate. Watts = Voltage * Current. Watts create heat, which must be dissipated by the heatsink.
Since you're wanting some respectable current from this project, you could do as you suggested; remove a few windings from the 20VAC secondaries to reduce the power that the pass transistors dissipate. But, depending on the construction of the transformer, it might be difficult to do.
Another way to reduce the voltage from the transformer is to put a "bucking" transformer in the primary of your transformer to reduce the primary voltage to it.

As others have indicated the increased voltage will cause the transistors to have to dissipate more power but the result will be better regulation. I recommend that you don't use the 3055 transistors, there are better choices. I blew many of them before replacing them with ECG 181, there is a 2N number this is equivalent to but I cant remember it right now.

Jimmie

Find a 240/50 volt transformer , and wire the 50 volt output in
antiphase with the mains input to the target transformer, and don't fool
with windings at all....

240 volt input with 55 volts (antiphase) i.e. 'bucking' the 240 input
is 240 minus 55 =3D 185 volts. The input voltage being educed from 240
to 185 volts. And 185/240 =3D 0.77

With that the two remaining secondaries would be 20 x 0.77 =3D 15.4
volts. Maybe that's a little bit too low for what is needed? But worth
a try?

But also if the 55 and 240 windings are connected in series (aiding or
in-phase) and 240 is applied to that; we could have a 240 + 55 =3D 295
winding.

Then with 240 connected to what is now, in effect, a 295 volt winding?
So 240/295 =3D 0.81
And 20 x 0.81 =3D 16.27 Very close to 16.5?

Also' and if NOT with two 6 amp rated secondaries I would certainly
'try' getting 9 amps from each of them.

BTW the insulation of any secondary connected in series with the mains
voltage primary must have adequate insulation to withstand peak mains
voltages (about 340 v AC). I haven't done this at 140 volts but have
done it at 120 volts; by connecting 12 volt secondaries in series with
the input to simulate voltage increase/decrease of plus/minus 10% etc.
It worked fine when I didn't have a variac!

> to 185 volts. And 185/240 = 0.77
```

Make that 240 V AC less 50 V AC = 190 V AC input to the toroid.

That would provide 190/240 X 20 volts = 15.83V   Close enough.
>
[Stan]
> With that the two remaining secondaries would be 20 x 0.77 = 15.4
> volts. Maybe that's a little bit too low for what is needed? But worth

> winding.
>
> Then with 240 connected to what is now, in effect, a 295 volt winding?
> So 240/295 = 0.81
> And 20 x 0.81 = 16.27 Very close to 16.5?

Well, let's see now.   If you choose that rather intriguing approach
of applying its own secondary to buck the input, what might the 20 volts
outputs really become?
240 volts input into a 240 + 55 volt winding pair means that the 240
volt input winding gets 240 / 295 volts, so the outputs would be
(50 V nominal) = 40.7 volts
and
(20 volt nominal) = 16.3 volts

But WAIT: that 50 volt winding does NOT develop 50 volts, but rather
40.7 volts so the 240 V input winding gets 240V - 40.7 volts = 199.3 V
So the 20 Volt output is 199.3/240 volt X 20 V = 16.6 Volts....(or a
smidgeon higher?) This sounds good!
>
[Stan]

> the input to simulate voltage increase/decrease of plus/minus 10% etc.
> It worked fine when I didn't have a variac!

Actually, with careful wiring, this concern for increased PDs on the
secondaries is unneeded.   If the secondary bucking windings are placed
on the neutral end of the supply, then the increase in the peak primary
PD is percentage wise quite small....

In summary, using secondary windings of the SAME transformer to buck the
mains input is a neat idea if you can find the ratios you need, and
doesn't seem to add much risk to the enterprise

Now that the ideas are cooking.... consider this.
1100 watt defunct microwaves can be had for the asking.
They have a particular transformer core design that makes it easy to saw off the 1 KV secondary, and with the generous core window, you could wind 18 to 20 turns of wire good for 10 amps. The turns per volt is not much over 1 tpv....   And you have a decent rectifier diode for the

spares box too....

Admitted - a bandsaw in the workshop makes a 15 minute job out of this
transformer hack.(if you don't nick the primary)

Brian, I have done this with old uwave transformers, the ones I could knock out the magnetic shunt with a hammer and punch, but on the newer ovens the shunt is a weld. Will these still work?

I left the magnetic bypass leg in the core on the one I used for a spot
weld source. Its a security blanket against core saturation due to the
magnetron,I reckon.

thanks for all the comments folks. I considered all and decided to take
the learning curve. I was lucky the transformer was only held togethert
by a non sticky clear plastic wrap.
Having unwrapped the windings I took the 55v secondary off completely.
Re the 20v secs, I worked out the value in volts of each turn, then
removed 8 turns from each of the 4 secs. I now have 16.48 volt (near
enough to 16.5 volt for me) I had to re-space the secondary windings
(i did it to look neat - there may be a sound physics reason too).
Lets hope it works. Before the 'surgery' the 20 volt secondaries were
good for 18amp in parallel (according to manufacturer). Tim stated that
lowering the volts to 16 will give 25% more current. so I should be good
for at least 20 amps. I only wanted 15 so the margin is ok.

thanks again folks Andy

Hey OM:

Hope those transistors you are going to use have low SAT otherwise you are not going to get 13.8 volts.

And I know for a fact the the regulator will have a hard time regulating that close to the rail. Been there done that. You are going to need another winding in there to supply the regulator with around 29VDC.

73 OM

I _think_ that shunt serves to limit the secondary current and therefore
protect the magnetron.

I should go through the math on that...

No no. Tim stated that _after_ you _completely_ rewind the secondaries
with wire that's got 25% more cross-sectional area you can run 25% more
current. if you increased the secondary current to 20A the per-inch
dissipation in the secondary would go up by about 56%; you can probably
run more than 16A in the secondaries now because they're more spread out
and because the primary will be cooler, but I very much doubt that you
can go as high as 20A and maintain the same temperature.

It's certainly possible you know better than the original designer - and
that the power transistors he specified need more than 16.5VAC X 1.414
(to peak DC) less 13.8VDC output - that's a max headroom of 9.5 volts
DC.   But perhaps you were taking the input AC value for the input DC .
It's all I can think of....

I'd have to dig up the instruction manual to see what they have to say
on that. However I do remember assembling it according to the
measurements given in the manual and the antenna worked fine mounted
with the bottom at eye level with me standing on roof. The antenna was
mounted on a mast strapped to the side of the house. I now have the
antenna mounted at the same height, but using the GAP tiltover mount
hardware attached to a short length of Rohn #25 tower against the side
of the house.   I don't think the GAP Titan is very sensitive to height
above ground, at least as far as tuning is concerned. Angle of
radiation is probably another story....

Is this transformer potted in the middle?
If it isn't you could add some turns and connect them in series with the
primary to reduce the secondary voltages.  This would be a lot easier
than removing turns from the secondaries, especially if the secondaries
are NOT wound on top!

OK, we are all being technical here - can I ask if the crowbar IC is
still available? Is the specified relay still available?

At an overvoltage condition,there will be over 200 watts being
dissipated in the 2r2 resistor in series with the SCR - hopefully it
```

wont instantaneously go open circuit....if the overvoltage protection works, wont the thing go into cyclic oscillation as it attempts to restart?....(not sure here, perhaps the gate never goes low enough for this)
LM723 regulators tend to be a bit unstable - VHF ground plane type construction is recommended.
The transformer ratings - the manufacturer rates them at a specified current for a reason. For low duty cycle use, eg SSB, you can get away with pulling more current. But a solid state Class C FM amplifier? - also, as mentioned, there is very little headroom at 16v - 18v would be better.....and thats assuming the mains input voltage is reference quality - here in OZ, its a design variable, up to 20% fluctuations are not uncommon, especially at the end of a long run.
Motorola 2N3055 transistors are fine - BUT- when the original Motorola patents expired, and Motorola stopped making them, a lot of substandard crappy ones (typically Eastern European) came onto the market. Be warned, they can be unpredictable. TO3 is a pretty well obsolete case style anyway. Good luck. And the Motorola symbol was widely forged as well.

The above, of course, are my Neanderthal rantings on a newsgroup and will no doubt start an impassioned debate on points of theory , or maths, or how it was done in 1935. Remember, free advice is worth what you pay for it.

But I would advise putting a 5w 15V zener across the output terminals, and before that put a 30amp fuse. Minimal cost for added insurance.

Go for it - build it, experiment. Blowing something up is always a fantastic spur to learn the correct theory for the application..if it works first up, then its just a mechanical exercise.

Andrew VK3BFA.

```

I drive a 1988 dodge dakota which has an electronic control module to
control timing and fuel delivery.I've installed a 10/12m ranger 2970
radio in it.I've also modified the radio somewhat by installing a
modulation/speech processor/compressor.My modulation is presently at
95%.When I key the mic. the ECM becomes flooded with RF and disturbs
the control to the fuel delivery and timing to the point of stalling
the the truck.I've tried to RF harden the ECM by wrapping it in tin
foil.I'e also added a DC ground that runs from the radio to ground and
to the antenna then back to the truck ground.Still the problem
exists.Any suggestions short of removing the speech/mod compressor
will be greatly appreciated.   73s...K2NBO....

Off the top. If the trouble started after the compressor was added, it might just be that current spikes from the radio are getting to the ECM.
A choke and bypass right at the radio power input lead might fix it...

Brian W

I think the give away was the speech compressor and 95% modulation.

Modulation and power mods by universally shady mod techs usually buys you a steaming pile of crap, broken warranty, and only serves to call every one on the band to your channel. Eleven meters is heavily populated by suckers whose main goal in life is to try to get something for nothing.

HI,

Often I can see coils where some turns are shorted in order to modify there value.
I wonder whether these shorted turns would not be seen as a short cicuit and could decrease the quality of that coil.
How can I have an idea of the lost of quality without complex equipment ?
I plan to build this kind of coil for a shortened antenna...

regards

Good question! I've always wondered about that too. In a former life as a
marine electronics technician, the old marine "AM" transmitter antenna
tuners uses shorted turns a lot. It always sort of went against the grain, I
thought, but in practice, it seemed to work ok. What was I missing here?

My understanding is that the presence of the shorted turns in the coil does lower the Q of the coil somewhat. If the loaded Q of the system/application is already low enough, the reduction in coil Q doesn't result in an unacceptable increase in losses.

The alternative, in some cases, is to leave the unused turns open at one end. This isn't always possible, and when it is possible it can have an unfortunate side effect. Autotransformer action can cause the open end of the turns to develop a high voltage relative to the rest of the system, and there can be arcing to nearby points of lower potential. Could make a mess of the inside of your transmatch :-(

In many military antenna tuners, the variable inductor inside the tuner was open on one end. The coil was rotated such that the length of the coil winding was changed, or the position of the tap was changed to effect the tuning. There were also some tuners that spooled one end of the coil onto a grounded metal drum. The mechanism changed the effective length of the coil, but did not introduce any shorted turns.

If the shorted turns are connected to one end of the coil then the total shorted turns would appear as the final turn of the coil. In amateur transmitters the band switch often shorts turns from the cold end of the tank coil as one switches to higher frequency bands. The shorted turns simply are not in the circuit I guess.

The circuit to shorten turns in such environments has to be very low
loss. Otherwise you will have lots of power lost in this short
circiuted parts of the coil. And in PA / antenna environments you
always have power. This is why switches are always "heavy duty" in PA
and antenna switching units.

If you do so, the current in this shortened turns is a complex
current. And as you know, complex currents do not consume power. Only
the real parts of current do.

This is totally different from the situation e.g. in a power
transformator. If you would shorten turns there, you would have power
loss, because the resistant of the turns in power transformators has a
much higher real part compared with rf coils in PA / antenna units.

OK?

This seemed like an insightful response - but not one with universal appeal.

Let me try embroidering on this theme a little more....

The leakage path for current in an insulated wire is strikingly

different from the leakage path in a magnetic conductor - usually called
a core or stamping.
The leakage resistance can easily be 1000 megohms compared to the
conductor's resistance of (say) 1 ohm. A ratio of a billion to one.
The leakage path for cores and stampings is lucky to be a thousand times
more "resistive" than the path through the core - if it's an iron
stamping, an iron dust core, or a ferrite core. A ratio of a thousand to
one.
For air cored coils, the leakage path is lower still, so that the
magnetic path does not couple all turns together at the best of times.

If an end turn or two is shorted, the reactive current in the shorted
turn pinches off most of the magnetic coupling from the remaining coil
altogether, so the effect is not as dramatic as we might expect.
Waddaya think of that?

Brian W

Thanks for this posting. You are totally right. I tried to explain
thinks a little more easier. And if you try to reduce complexity in an
explanation, you have to simplyfy. Looks like I simplyfied too much.
My fault.

Hi,
Thanks everybody.
I just found your answers, so I will work with them.
I've also found some other info on my old handbook ARRL.
Thanks again

Raph

No, no, no..... your explanation was right on the mark! Many of us
thoroughly enjoyed your reduction of
imaginary numbers and such into a down-to-earth, homebrew response. Well
done!

It's actually not too difficult to come up with a reasonably accurate
model that you can then analyze...for example, you can put it into
Spice and look at the losses, the lowering of Q, etc.

What I've done to build the model is to consider that the shorted
turns are one coil and the remainder of the turns are another. Before
those turns are shorted, each of those two coils (that happen to form
one coil) has a self-inductance, and when they are put end-to-end to
form the one coil, they then also have mutual inductance. You can use
your favorite coil inductance calculator to find the inductance of
each of the two individual coils, and the net single coil composed of
those two. Those three inductances let you calculate the mutual
inductance (or the coupling coefficient), and that's the core of the
model. You can add in the RF resistance of each coil: there are
various ways to get a good estimate of the Qu, and from that you can
get the RF resistance at the operating frequency.

If this is too muddy, I could offer a specific example...

Cheers,
Tom

As well, it would be interesting to see the effect of stray
capacitance, as the reason for shorting unused turns is to reduce the
problem of stray capacitance and the inductance having unwanted
parasitic resonances in the system,   That is why shorting unused
sections is normally advocated.

Well, its the better of the options but the Q of the 'desired' coil
still takes a hit because of that nearby lump of copper.

It works out ok in practice, though.

So, just for fun I ran an analysis this way...
I asked the Hamwaves on-line inductance calculator about three coils,
all 2.5mm wire, 5mm pitch, 75mm mean coil diameter, default copper
wire. You can put effective shunt capacitances into the model too,
but I didn't in this case. The test frequency is 10.0MHz. These are
the "lumped equivalent" values.

L1: 13 turns 65mm long --> 9.272uH, 0.491 ohms, Qu=3D1187
L2: 17 turns 85mm long --> 13.191uH, 0.646 ohms, Qu=3D1283
L3 (L1 and L2 end to end): 30t, 150mm --> 26.600uH, 0.880 ohms,
Qu=3D1899
(My impression is that the RF resistance and Qu calculation yields Qu
that's a bit too high, but that's what the calculator says...)

From these, I calculate the mutual inductance. L1+L2+2*M =3D L3, so
M=3D2.0685uH. Coupling coefficient equals M/sqrt(L1*L2), or 0.187.

I put L1 and L2 and their respective RF resistances in series in

Spice, with a resistance representing a shorting switch across L2. Note that this model, with the switch open, will give an RF resistance simply equal to the sum of the RF resistances of the two coils, which isn't the same as the Hamwaves calculator gives for L3.

The results are kind of interesting. It doesn't take much shunt resistance in the switch to lower the Q (increase the net RF resistance). You want to be sure your switch is really OPEN when the coil isn't shorted. You can actually stand quite a bit of resistance (a good fraction of an ohm) when it's shorted without really bad effects. Here are the results I got, again at 10.0MHz:

R(switch) ohms	L(net) uH	Effective net series resistance ohms	Qu
1e9	26.598	1.138	1469
1e8	26.598	1.146	1458
1e7	26.598	1.229	1360
1e6	26.598	2.056	813
1e5	26.597	10.32	162
1e4	26.476	92.4	18.0
1e3	19.405	545	2.24
1e2	9.201	132.4	4.37
10	8.950	13.886	40.5
1.0	8.947	1.845	305
0.5	8.948	1.175	478
0.2	8.947	0.774	726
0.1	8.947	0.640	878
0.05	8.947	0.573	981
0.02	8.947	0.533	1054
0.01	8.947	0.520	1081

Cheers,
Tom

Exactly Bill, and the whole thing really is a matter of just what is
the needed, or acceptable Q.   If the Q is satisfactory with the
shorted turns, then that is the way to make your design (keeping in
mind the disadvantages of open circuit unused turns).

However should you need the highest obtainable Q, then a single
isolated coil is called for which has the needed turns.

Peter

Anybody have a source of plans for a solid state 222 amplifier project?
  Looking to use discrete transistors (versus a 222 brick module) for a
little more power out. Looking for something that will take something
like 5W in and give 75-100W out. Design should use 13V power supply.

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

I have a clean photo copy (from Trucker) of the Panoramic Radio Products, Inc. manual for their Models SPA-3 and SPA-3/25 along with a big cable labeled "Singer Metrics 556161-096" which I think is the interface cable between sections. The manual has schematics, parts list, operating instructions and calibration sections. The schematics have 1958 dates on them.

I have no use for these. They weigh about 4 lbs.

Email me if you can use these.

In a box of traded parts I found a cylindrical object labeled "Clevite Ceramic Filter TL10D16A" that may be some sort of IF filter according to very dusty old memory files. I would appreciate it if anyone knows of this brand and can give me an approximate center frequency and, perhaps, impedance loading of terminations.

Hermetically sealed about 1 1/2" long by 1/4" diameter, leads coming out ends of metal case. Unused by appearance of end wires. Perhaps 30 to 40 years old? Trader had no idea where he got it (probably in a trade of his).

Clevite is an old company and was purchased by Gould Electronics some time in the late 1960s. Can't find anything on this part in web search now.

My thanks for reading. If anyone has any info, feel free to post it privately or publicly.

73, Len AF6AY

I've got one which looks identical, but with a different part number (TL6D11:A). Mine is a 455KHz centre frequency, 6KHz filter which was used as the AM filter in the UK/PRC-316 radio. From the circuit, I'd say it should terminate in 1K ohms.

Clevite was a UK company, based in Southampton, and part of the Brush Electrical group. They specialised in ceramic filters - and seem to have been one of the first commercial suppliers of these. I've got other equipment which uses Clevite filters, and I can assure you these are not cheap alternatives to crystal filters - they are high grade components in their own right.

I'll bet your item is on one of the standard IF frequencies - try 100KHz, 455KHz, 1.4MHz, 5MHz etc.

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to rec-radio-info-request@panix.com.

All this very interesting; because many, many, (like 50+) years ago I built a signal generator, that didn't work! Nice job in an ex-Admiralty copper lined wooden box!

Came across a complete set of coils with a multi position switch which covered a wide range of frequencies. Tested it out breadboard fashion and it worked fine. Then built it into a double layer chassis constructed from two thick and therefore potentially rigid and frequency stable pieces of Aluminum!

But what I had done was dismount a set of coils from a plastic frame and mounted them in holes drilled into the two opposite panels of aluminum. Nice job mechanically but what must have hap pend is the Al. panels provided shorted turns in the same plane as the winding of the coils and reduced their Q to where the (tube, inductive feedback) circuit wouldn't work.

Never got time to work on it because I then emigrated to North America and the unfinished item is long gone. Had a nice Muirhead slow motion drive on it too!

Live and learn!

In at least some editions of "Reference Data for Radio Engineers,"
there's a graph of how much the inductance of a solenoid coil is
lowered by being placed inside a shield. If the shield isn't too
close to the coil, the percentage decrease in inductance is rather low
(the coil isn't affected very much). The graph doesn't tell you how
much the Q is lowered, but I did some comparisons of Q estimates from
a couple different solenoid coil programs I have and Q estimates for
helical resonators, and came to the conclusion that you can account
for most of the lowering of Q by assuming the RF resistance remains
constant and the inductance is lowered, per the R.D.R.E. graph
(attributed to RCA). That assumes a highly-conducting shield, I'm
sure. The observation helped dispel the "magic" aura of helical
resonators: their Q is actually lower than the Qu of the coil they

contain, if that coil is in free air. (A big advantage, of course, is that they are fully shielded.)

Cheers,
Tom

Seeing you have a tuner, I would go with an 80 meter dipole fed with the
ladder-line. One antenna for all the bands 80 thru 10. FWIW

This gets to be a jello-y area if you follow the clues far enough. The coil's Q, or better said, the circuit's Q has a lot to do with how much spacing is required. Old timey Rule Of Thumb suggests one diameter spacing away from enclosures but thats typically relative to lower Q coils which are common rote. I make that comparison against high-Q coils in dx crystal sets where 12-18 inch separation isn't uncommon.

The textbook Q formula doesn't address this...nor is it a necessarily a biggie because most of the coils that we encounter in the situation presented in the original post aren't of high enough Q so as to present any problem.

But, it needs to be reminded that coil Q is definitely subject to its surroundings. Re-tweaking the inductance value is easy enough but you cannot recoup the loss of Q. It always depends on the specific application.

Tossing out another option....

I once used a "quarter-wave sloper" off of a grounded 50 foot tower. Tower was used as a "ground plane". It did a very convincing job for DX on 40 m and was somewhat directional.

Having multiple antennas is always a bonus. Add one of these to your antenna switch!

Or...skip the HF antennas and put up a converted 18" DirecTV dish and
get on 10 GHz. At ground level and 2W, I made a 180.5 mile QSO during
the 10 GHz and Up contest last month. Didn't even break a sweat ;)

I have the following General Radio equipment for sale. All of it is
in very good condition and working:

The following items I would like to sell as a set:

1	874-LB	55 cm Slotted Line
1	874-LV	Micrometer for the slotted line
2	874-LTL	Trombone lines
1	874-GA	Adjustable Attenuator
1	874-L30	30 cm Air Line
3	874-L20	20 cm Air Lines
4	874-L10	10 cm Air Lines
1	874-F1000	1000 MHz Low Pass Filter
1	874-L500	500 MHz Low Pass Filter
1	874-D50	50 cm Adjustable Stub
1	874-D50L	50 cm Adjustable Stub
1	874-D20	20 cm Adjustable Stub
2	874-LA	Adjustable Line
5	874-T	Tee's
1	874-EL	Elbow
2	874-K	Coupling Capacitors
5	Small diameter cables with GR conn.'s on both ends	
2	Small diameter cables with GR conn. on one end and BNC on other	
1	Small diameter cable with GR conn. on one end and banana plugs on other	
5	Large diameter cables with GR conn. on both ends	

I will accept any reasonable offer plus postage. I can send pictures if requested

I can be reached at either wa0goz@arrl.net or 651-426-4144. Ask for Henry.

Hi All,

Modern engineering text indicates that for the same frequency, a large fully illuminated dish will provide more gain than it=92s smaller equivalent. Why is this ?

Consider the following scenario:

=3D=3D=3D=3D=3D=3D

Take a 10GHz RF source, and attach an appropriate feed horn to fully illuminate a 2m dia dish.

Adjust focus so that the wave front out of the dish is parallel (2m diameter ?)

At a distance, arrange the same setup, except the RF source is replaced by a detector.

Make a note of received signal strength.

=3D=3D=3D=3D=3D=3D

Repeat the same experiment at the same frequency, but with a 3mdiameter dish at each end, and appropriate feed horns .

Make a note of received signal strength.

=3D=3D=3D=3D=3D=3D

Also, see http://www.idesignz.org/misc/dishproblem.pdf

In both cases all of the TX energy is transmitted in a parallel beam, whose diameter is the same as the respective dish.

It would seem that if you can fully convert all of the TX RF into parallel waves, at some point the diameter of the dishes should not make any difference to the transfer efficiency of the system.

So, why would the received signal for the 3m + 3m dish be greater than that of the 2m + 2m dish experiment ?

Thoughts please.

Mark

A parallel beam is not formed, rather a slightly expanding beam due to diffraction.

Diffraction also limits the resolving power of an astronomical telescope, so when looking at some binary stars, a small telescope will show only a single blob, a slightly larger telescope will show an elongated figure (e.g. figure of 8) and an even larger telescope will show two separate stars.

The diffraction limit is defined as 1.22*wavelength/diemeter radians or about 70*wavelength/diameter degrees.

Diffraction also controls the beam spreading from a parabolic disk or laser. For this reason, a laser (with an aperture less than 1 cm) can not be used to illuminate the reflectors on the moon, but typically the laser beam is transmitted through a telescope with typically 1 m diameter. The beam is 100-1000 times narrower than the beam from the laser alone. The area illuminated on the moon is 10,000-1,000,000 times smaller and hence reflected power that much stronger than with a bare laser.

Hey OM:

Yes how is it? Bigger is better.
I mean you are using the same source for both antennas but how does the larger one have all that extra power, being emitted and where does all that extra power come from?

So instead of using that 400 watt microwave oven I just get me a 30 foot dish and a 20 milliwatt emitter and save all that money I would have wasted using the microwave oven, cooking my turkey.

It comes from "focusing" the existing energy. No new energy is created.

Yes, you *could* do that with a turkey. Just like you *could* cook it with a magnifying glass out in the sun. :)

Hey OM:

Take a 60db gain dish illuminate that with 20 milliwatts of power.
Your ERP is now 20,000 watts.

My question raises the bar, how can you focus 20 milliwatts of EM particles and waves, to end up with 20,000 watts of EM particles and waves? And I can bet that it's all those extra particles that are going to be cooking my turkey.

There's only one way that can happen: the dish is a storage device: the size and frequency of which determine the storage capacity in this case the storage capacity gives me a 60db gain. And will always give you 60db more than you put in.

73 OM

60db in one specific direction more than if same amount of RF was
dissipated equally in all directions. Correct?
Would not matter if starting with one milliwatt, one watt, one
megawatt.
The beaming effect will concentrate the available energy from all
directions in a specific one.

EIRP, actually ... Radiated power, relative to a (abstract) isotropic radiator.

> My question raises the bar, how can you focus 20 milliwatts of EM
> particles and waves, to end up with 20,000 watts of EM particles and
> waves?

You can't. You're just focusing that 20 mW of power in the "useful direction"

Imagine an incandescent light bulb hanging from a wire -- this is a reasonable metaphor for an isotropic radiator - it puts out (nearly) the same amount of light in all directions ... If the light isn't bright enough to read a book, you might put a reflector behind it - there is no more light being generated, but the page just got brighter, because some of the energy that was illuminating the garage roof, your head, the walls and the junk on the shelves is now illuminating the page.

> And I can bet that it's all those extra particles that are

There are no particles, and there are no "extra" particles.

Indeed - first you heat one molecule of water, then refocus the beam, heat the next, repeat 6 x 10**23 times for each mole of turkey.

Hey OM

What you are saying is that I can take a 20 mW emitter and with an infinite size dish I can get infinite power from a 20 mW emitter?

No way you can get infinite power from a 20 mW source unless the dish is supplying the extra power. In other words it's not possible to get infinite power focused from a 20 mW source, and that all that power is coming from the 20 mW emitter.

Take that 20 mW emitters' isotropic pattern, there is a potential of an infinite amount of power in that pattern because it can be focused?

Frying that turkey only takes 20 mW of total power period. And it may or may not be from focusing the 20 mW. The turkey gets cooked with 20 mW is still a fact that can't be refutted.

You can get infinite *Effective Isotropic Radiated Power* from 20 mW with an infinite dish. Not practical, but theoretically correct.

You're misunderstanding EIRP, Effective Isotropic Radiated Power. If you feed a 60 dB parabolic antenna with 20 mW you get the equivalent of feeding a theoretical *isotropic* radiator with 20 kW, the key word being 'isotropic,' meaning that 20 kW is being radiated in all directions. Your 60 dB dish directs your 20 mW *in a specific direction* with a *specific* beam width. *In that beam* the field strength is the same as it would be from 20 kW *going in every direction*. The ratio of every direction to your dish's beam width is 60 dB.

> is supplying the extra power. In other words it's not possible to get
> infinite power focused from a 20 mW source, and that all that power is
> coming from the 20 mW emitter.

You're not getting infinite power, you're getting 20 mW focused into a
finite beam width and in that beam width it has the same field strength
that 20 kW going in all directions would give you.

> Take that 20 mW emitters' isotropic pattern, there is a potential of
> an infinite amount of power in that pattern because it can be
> focused?

Only if it can be focused into an infinitely small point which you won't
get from any finite gain antenna.

> Frying that turkey only takes 20 mW of total power period. And it may
> or may not be from focusing the 20 mW. The turkey gets cooked with 20
> mW is still a fact that can't be refutted.

Part of that fact is it will take a long, long time to cook it with only
20 mW because you can only cook (defined as raising the temperature to
about 160 F) a very, very small portion of the turkey at a time with
only 20 mW.

Does anyone have any 10X, FT243 or HC6/U style crystals on these
frequencies?
3.560, 10.100, 10.116, 10.140 (all in MHz)
Any help would be appreciated - willing to pay costs.

AFAIK Jan and Fox both still make HC6/U crystals to whatever frequency you want.

There are ads in QST for crystals in FT243 holders, although I'd be leery of quality until I'd had some mileage with a particular vendor.

So if you don't mind new (and new prices) you can get what you want.

I saw one at a hamfest in the tailgate section someone was trying to
sell that was turned into a HV power supply and it used a pair of
microwave oven transformers.

Jimmie

Instead of the 1 KV power supply at 1 Amp, there's the possibility of bandsawing off the high voltage winding all together, and winding on 5 or 6 turns of welding cable.   This makes a useful spot welder for stainless steel sheet, which material performs specially well with spot welds.
The power is low end so its important to choose a microwave rated at least 1100 watts for this makeover.

Same technique (cutting off HV winding and putting a few turns to make
a battery charger transformer was also mentioned.
And previously had mentioned that HV winding to 115 volt mains winding
was a turns/voltage ratio of approx 20:1.
Hence an impedance matching ratio of 400 to one! Might be good enough
to match an 8 ohm speaker load into say a triode connected power tube?
400 x 8 =3D 3200? Haven't tried it! Just rambling around. Hate to throw
stuff away.

"The Si473x, Si474x and Si4707 devices are the industry's first fully
integrated, 100% CMOS AM/FM/SW/LW and WB radio receiver ICs. Offering
unmatched integration and PCB space savings, the Si47xx only requires
two external components and less than 15 mm=B2 of board area excluding
the antenna inputs."

In chippic language, this thing has PGA, DSP, ADC, DAC. While there's
a PGA block that seems non-FP, the DSP is upgradeable - hence
reconfigurable, although I bet the code is closed and well guarded.

In radio language it implements 2x AGCed LNA, 4x balanced mixer, 2x I/Q detectors, DSP demodulation, RDS/RMBS, both digital and analog audio out (stereo of course).

https://www.silabs.com/products/audiovideo/amfmreceivers/Pages/default.aspx

https://www.silabs.com/products/audiovideo/amfmreceivers/Pages/Si473435.asp=
x

The application notes document for antenna selection and layout is not to be found on the Silicon Labs website, is still under NDA but a version for a shortwaveless version has leaked from Russia.
http://delanet.ru/images/stories/pdf/AN383_si4711.pdf

Several chips in the that family have transmit capabilities too, complete with varicap antenna tuner.

A quasi-SDR-SOC, taking up less room than a small knob.

Hi All,
 I'd like to buy some back issues of QEX. Preferably from the last 4 yrs or so.
Please respond by email.
                     Thanks, Mike

You should put a wanted ad on qrz.com & eham.net since
a lot of hams check the want and sale ads every week.

Go to ARRL.org and buy the CD's.

Go to ARRL.org and buy the CD's.

Ya, I thought about it, but I like the physical magazine.
Thanks, Mike

im an EE, but have never gotten into ham radio. Now, I have a reason!
Im going off roading in the california desert, and I'd like to be able
to communicate back home in San Diego. What band and equipment would
be the best (for both base and mobile) in order to communicate
reliably during the day? Or is this unreasonable?

Someone will disagree, and we'll both learn something...

For getting through with just your equipment probably HF; on a truck it's probably best to count on 20m, although at that distance 80m is inherently 'better' for ground-wave daytime local-ish communication.

For getting through all the time, and assuming there's coverage, a repeater. It won't get you all the way home unless there's a phone patch available or an intertie. Since repeater clubs have widely varying policies regarding furreners using their equipment, and the most common arrangement is that anyone can use the repeater but only club members get the magic finger ring combination to open the patch or the intertie you may want to do some research.

For getting through all the time, with cost and effort rivaled by buying a second rig to tow behind your main rig just so you can drive home, you could set up for satellite operation. I'm not recommending this unless you just plain want to have fun with it, but there you are.

Note that _all_ of these options except for the phone patch require that you have someone with an amateur license and a matching radio on the other end.

In the height of summer, in daytime, a maximum of around 300 miles would
be normal for 80m, but I think you'll be lucky reliably to get 500
miles. In fact, apart from very local stations, you could find 80m
totally dead between 11am and 2pm. Depending on ground conductivity,
groundwave goes out to around 20 miles before skywave really takes over.

If the sunspots on the sun had been a bit more active, and conditions on
40m had been 'normal', this band would have been a the definite
'general-purpose' choice. Groundwave is noticeably less than on 80m.

Typical communication range is 50 to 500+ miles.

On 20m, 100 miles is a bit close. You're unlikely to get reliable communication at less than 250 or 300 miles. Groundwave is even less than 40 - maybe only 5 miles.

I think you might be better off getting a CB. If only because when you need help, you are much more likely to find someone nearby with the ability to reach you or summon help.

If you want reliable communication over that terrain and distance, you need a satellite phone. Every else ranges from "will never work" to "probably will work most of the time", but not "will always work".

Of course the big question is why? Are you looking for help if you need it?

Are you just looking for a way "phone home"? Do you expect to have your
employer/customers call you for support?

Geoff.

Agreed. Unless there are any hills in the way, legal 27MHz CB should get
you a reliable 5 to 10 miles and, in the USA, I believe is a lot more
popular than elsewhere, and you could well be within range of other CB
users. And you don't need to pass an exam to get a licence (or even have
a licence). However, especially for real emergencies, it would be unwise
to rely on any ad hoc forms of radio communication. A satellite phone
would seem to be the way to go.

Thank you for all your excellent and useful responses!

To clarify my purpose:

1- I've been waiting for an excuse to get into Ham radio. I'm very
interested in learning RF circuitry (Experimental Methods in RF Design

is enroute as we speak), and this is a perfect opportunity, because I actually need it! So Im up for getting a license.

2- The purpose of the radio is for emergency and for the cool factor of being able to talk to home from 100+ miles away in the desert and tell them about all the sand and rocks i see. Exciting for them!

3- The CB does sound better for emergency. So now, lets change the purpose of the ham radio to just "cool of taking to home 100+ miles away". And I will get a CB for emergency.

I had been leaning toward 20 meters since it has been described everywhere as the DX band of choice. Now I see that it may not work well so "close" as 100 miles. But wouldnt 80 meters have even more of a problem? I am still not clear on which band to use...maybe some more help please?

> Agreed. Unless there are any hills in the way, legal 27MHz CB should get you a reliable 5 to 10 miles and, in the USA, I believe is a lot more popular than elsewhere, and you could well be within range of other CB users.

From what I have read it is very popular in the EU which has far less limitations on what you can do with it. There seems to be no practical limitation on equipment and power, I often see articles about people using 100 watt ham rigs, transmitting FM and packet data.

However, that's almost irrelevant, a 5 watt rig, even a 1970' handheld with channels 9,14 and 19 will do, a 40 channel ssb rig would almost be too much.

To keep it almost on topic, if you were to buy a long whip antenna, fold it over, (run it horizontaly), and connect it to an autotuner, you could use it for CB and NVIS ham communication.

NVIS is an interesting mode of communication, it uses vertical skywaves to get wider range local communication from HF radio.

It may all be a moot point anyway. If you join a club they will probably tell you what equipment you need. They probably standardized on something readily available without a license such as CB's, FRS or GMRS, or possibly if they thought no one would notice VHF marine radios (which are illegal to use on land, but required for almost anything that floats).

Geoff.

Ok, so that needs a general class or better license at both end. Do you
have a family member interested too?

Look up NVIS, I described it in a post that crossed yours.

Geoff.

I guess a cellphone is out of range? You're not going to have reliable
"100+ mile coverage" with a CB or even with ham radio on a simple "push
button to talk" basis unless both parties are licenced and have some
knowledge about how radio works.
You need one of those 'illegal' phones like they sell in Brasil :)

Sat phones do this type of thing, not inexpensive though. Some of those
Brasilian phones illegally utilise military frequencies via US-DOD
satellites!

May I recommend a digital camera, 99 cent spiral bound notebook and a
pencil as the latest and least inexpensive technological breakthrough?

Not legally! In the UK, CB is limited to 4W of FM. Most other European
countries are very similar, although some do also allow SSB (and maybe
even AM?).

I don't think that you get much NVIS on the higher HF amateur bands.
However, you certainly do on 80m, where (at least in the UK) most
horizontal antennas are rarely much higher than 30' or 40'. The RF goes
straight up, and (if there's anything up there to reflect it back)
straight down again. In summer daytime, the RF tends to get absorbed by
the low-level D-layer (rather than reflected), so ranges are short, and
signal levels poor. This disperses at night, and the much-higher F-layer
allows a longer-range 'bounce' - even for signals with high-angle
radiation. Most really long distance stuff is via vertical antennas,
which are notoriously poor for relatively short-distance working (beyond
groundwave range). However, above around 5 or 6MHz, high-angle signals
tend to go straight through the ionosphere, and are lost for ever.

I don't want to be a 'misery-guts', but I would be a bit circumspect
about the idea of 'getting into amateur radio' because you want to be
able talk to the folks back home when you are on holiday. If you have no
previous experience of the characteristics of the amateur bands,
equipment, antennas etc, it's highly unlikely that you will be very
successful. To avoid disappointment, it might be best to stick to
tried-and-tested technology. On the other hand, why not simply forget
about the folks at home, enjoy your holiday, and take up amateur radio
when you get back!

Go for it, then! You'll find that building stuff is definitely something that's only worth it if you have fun -- the days of building stuff on the cheap from dead TVs are long gone.

Nearly all modern HF rigs cover 160 to 10 meters, so what you operate on out there is pretty much limited by your antenna. What band is good is mostly determined by the state of the ionosphere, which changes with the day, time of day, day of the year, and the state of the sun. So I'd recommend that you get or make an antenna that's good on a lot of bands, and find what works best for you.

The only real caveat to that is that longer wavelengths and small antennas don't go well together, so the system tends to be much lossier for 40m and longer with your average car-mount antenna. That doesn't mean it can't work, it just means that you have to take more care with the antenna, or plan on packing a BIG antenna that you can put up when you stop.

Is it just me or is there ALWAYS someone on this group explaining why
somebody else should not try something or do something? How on earth
is anyone supposed to learn anything if they only do what they have
knowledge and experience in? This is what college does to people,
makes them extremely wary of learning things on their own or seeing
other people attempt to do so.

So you're explaining why I shouldn't go to college?

Hey, thanks!

:-)

I think that the OP is misinterpreting my comments! Trying to keep regular communication via HF radio - and especially HF amateur radio - can be very disappointing, especially at times like now, when there are virtually no sunspots to help propagation go with 'a bit of a zing' (sorry if I'm being too technical!).

It is indeed great fun to try and keep regular communication schedules, but I wouldn't take up amateur radio just to be able to talk to family and friends while on holiday - especially if you are going to set out on your holiday before you have had time to gain some experience about which bands (and which frequencies in the bands) to use, which times of day are best, which type of antenna you need to use etc.

There's a bit more to amateur radio than buying an off-the-shelf 100W multiband transceiver and an antenna (or antennas), connecting everything together, powering up and pressing the mic PTT button. But I'm sure the OP is already fully aware of this. I'm just a bit concerned that his planned debut into amateur radio might prove a little disappointing, and deter him from progressing further in the noble art. I'm certainly not trying to dissuade him.

Get a modern solid state radio that covers all HF ham bands and an
antenna such as the "Outbacker" or "Screwdriver" so that you have one
mobile antenna capable of being tuned to any HF band. I would say that
40 meters would be one of the better choices during the day but with the
multiband antenna, you try the different bands until you find the one
that works at the time you try calling.

Scott

Nah, he already said he's just using the "talk to home" thing as an
excuse to get him going, and he's already agreed to jettison it and get
into ham radio anyway (Good for you 'acannell'!).

And while there's more to it than connecting the bits together and
pushing the PTT, that's a good start.

(OP: Getting into a club is best; if you can't do that then at least get
a copy of the ARRL Operations Manual and read it before you go stomping
all over the airwaves. You'll have "newbie" written all over you no
matter what -- you want to aim for it to be "polite newbie" so people
will be nice.)

(And expect it to be a bit like newsgroups -- there are some read losers
out there and a few of them have call signs and HF rigs. Like any other
human activity there will be some hazing to politely ignore.)

is anyone supposed to learn anything if they only do what they have
knowledge and experience in? This is what college does to people,
makes them extremely wary of learning things on their own <or seeing
>other people attempt to do so.

It may have been the way you asked the question. If you had just asked what would be a good way of getting into ham radio and what would it take to talk around 100 to 200 miles for fun the response may have been differant. Your first statements made it seem like you wanted reliable communications for emergencies.

Anyway get a license and have fun. That seems to be your main objective.

If you have not checked into it, the license should be easy for someone that has an electronic background and any RF experiance at all. Just memorize the exect questions and answers. You can find them many places on the internet. You can go to arrl.org for one. Then go to qrz.com and take the practice test to see how well you are doing. You may even want to go there first and see how well you do without any perperation. Having been a ham for over 35 years and into electrical and electronic work, I can run through a test in less than 15 minuits and get around a 85% or higher. That is not even looking at the study questions in many years. I think a 70% is passing.

Ralph, a lot has changed in the last 35 years. The tests are not designed to make sure that everyone who passes could build a transceiver from an old AM radio, or recognize the design of one.

They are now based on the concept that many hams will start out with a store bought rig and work up from that. In order to pass, you have to show enough understanding of electricity, electronics and RF that you don't endanger yourself, anyone else or cause any damage to the equipment.

You also have to show enough knowledge of ham bands and operating procedure that you don't endanger anyone else, though you possibly could get some people upset.

BTW, have you taken the test recently, over the years it has included new
things that hams did not have to know or care about. When I studied for
the extra exam (1996)*, it included tv stuff such as fields and frames.
Now that NTSC is dead, I wonder if it is still there and if it is, how
long it will be.

Geoff.

* just to be compelete, I never had time to take the 20wpm test before I
moved here, so I have an advanced class license. I live in one of the few
countries in the world that the VEC's were asked NOT to give tests in.

I have taken the practice tests on qrz.com several times just to see how
well I can do. That is without doing any studying for them. Took it on
qrz.com a few weeks ago after our club had a hamfest and gave some tests.
Just wanted to refresh my memory of the questions.

I am a VEC with the local club. Have been from the time I passed the Extra. Forgot the exect year, but it was about a year before the FCC totally eliminated the 20 wpm code. Have to admitt that if it was not a choice question test that I could not have done the 20 wpm.

The test as it is now is made to get more hams on the air. I think it is good.
Should probably be more on the rules and operating proceduers, sort of like a drivers license test. There are very few new hams that can work on the modern rigs. I can handle the older tube and transisitor rigs, but do not even try to look at the latest rigs.

HOwever the test is a joke. Years ago my wife passed the the Technician test and I doubt she could plug in a rig and hook up the antenna.. Around 1972 I passed the first class phone test. Only 22 years old and had never seen a TV or comercial radio station transmitter, but that licened me to work on them. Never did get into the radio or tv field like I thought I would like to. Did not pay as much as the other jobs I had over the years.

NTSC is dead for comercial use in the usa, but probably will be used in the ham bands for a long time. Just as RTTY is. I have an old modle 19 set for rtty and it is still working. Must be around 50 years old or more by now. You can probably count the number of comercial rtty stations still on the air with one hand now.
Packet was hot for a few years, but I think it is almost gone except for a few DX clusters and the aprs system.
I think there will be some hams on almost all modes that have been used.

www.winsystem.org

Click on the link on the right that shows Site info/plots and see if your
area is covered.  Requires Tech class license or above.  May help in areas
not covered by cell phone.

HF mobile (requires General class or above) will work in areas not covered
by any other infrastructure depending on time of day and frequency
selection, which can be a problem because of the limitation of a
pre-determined contact schedule.  In any case, you should be able to talk to
somebody, somewhere who can get to a phone or e-mail.  The last resort would
be Sat Phone for use anytime, anywhere you can see the sky.

CB has mostly limited range.  You might get lucky if you are close enough to
a highway or town, but forget about 100-500 miles.

40 meters might be better. 20m if conditions permit. 80m at night but is more difficult for mobile ops. Your choice of frequencies depends on time of day, seasonal and subject to the ever changing ionosphere. Typically what frequency works at a given time of day will work the same time the next day but maybe not. Some study and experience is required.

I was the one who suggested he get a CB in the first place. It was not to
give him range, it was because it is more likely if he needs assistance
someone nearby will be listening on one.

That's also why I suggested he join an off-roader's club and use whatever
radios they do.

Geoff.

I understand. Yes, sadly, that is probably true nowadays. Calls on
most any 2M repeater in the USA go mostly unanswered, so if you need
some sort of assitance, CB may be the way to go. However, I applaud the
original poster on wanting to get a ham license regardless of whether it

would be the most practical route for him to take in his quest...for
times when he is not biking or whatever, he can chat with folks in any
of the four corners of the world (and actually, he CAN do it, even while
biking!) :)

Just to give some idea of the variability of 'Amateur Bands' due to
solar radiation, time of day etc.
Back some 50+ years ago had a war surplus receiver and on 20 metres
(14 megahertz) band could listen to the Australian amateurs rolling in
and chatting with the UK and Stateside hams early morning while f
getting ready for work. And this was with AM (Amplitude modulation)
and often with self built rigs. A few years later 20 m was dead.
(Sunspot cycle!).
Also operating at 5 megahertz military reserve frequency we sometimes
could transmit/receive hundreds of miles but not 40 miles to another
unit. It's radio!
Have fun.

Even with one of those illegal amps, you are still limited to the whim of
the ionosphere and absorption of the groundwave.  Especially if you are
stuck on 27 Mc.

True about 2m.  You never know where the repeaters are, what the frequency
and PL are, or if everybody is at work.  At least on $0 and 80 you can
always find retired old codgers.  The 440 or 1.2 guy might have his radio
right there in the shop or in the office and you can get a stern warning if
you disturb his private remote.

But CB might at least allow you to scope out where the hookers and drugs can
be found.

Yea verily.  What I was trying to say, only better stated.

Hey OM:

I seen a van on youtube this guy had two dual 4-1000a PA's, and a gas
powered generator in the back. On 20 meters he'd be rocking the world.
Do you think he was running class A? I don't think he was using it to
break pileups.

Oops, forgot about that aspect! It looks like you get more bang for the
buck with CB (no pun intended) ;)

All kidding aside, I still encourage the op to get a license and get on
the bands. It can be relaxing to yack on the radio when you're NOT out
biking or doing other things...

Hey OM

I am still tryin to cobble together a 4-1000a PA I first did my research googled the heck out of 4-1000a. By golly there is a tonne of stuff out there. I'm sure I found it while googling google video.

My base station would have frequency hopping beacons on all HF bands, so I could tell what the best frequency is to use. I would always get an update of the MUF off the internet. Along with any solar activity, the solar flux, A and K indices, sun spots are down so you won't have to worry about those for about 5 more years.

You just can't do that with a single band that's only a few Khz wide

Maybe he should go VLF like the bubble heads do and use D star digital on VLF band. With a big bug catcher basket wound coil on VLF would

```
look like a cooling tower on a van.

Archive-name: radio/ham-radio/moderated/crossposting
Revision: 1.1 2009/04/12 19:42:04
Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

This has got to be one of the most original bits of home brew art I've ever seen!

http://waterfuelcell.org/phpBB2/viewtopic.php?t=1034&postdays=0&postorder=asc&&start=0

Has anybody out there ever tried something like this? I wish I could figure out how to scale this down to wind smaller toroids.

BTW there is a commercial toroid winder on ebay right now, starting bid is $99 that will wind most toroid sizes useful for ham projects.

So you chaps enjoy siting round drinking brew's
and listening to the radio all day?
Its a good way to get through the 'so called' summer hollidays.
I like uk radio 4, its a grand station. It has plays , book readings and
radio documentaries, loads better than that strange 'beat' music I don't
understand.
Anyhow good on you chaps, you sit back have a brew and enjoy the radio.

Hey OM

Guess your link is broken.
Yeah being able to wind 4 AWG solid wire on a toroid would be nice.

I just tried the link and it connected.
Or you can google for 'home made toroid winding machine'

I wondered what the radio bit was - there are an awful
lot of radio topics. I thought this was a newsgroup for
amateur brewers, like me, who make their own beer and
wines and stuff.

I make wine, mead, and also a little vodka, but better
not shout too loundly about that ;-) I am willing to share
recipes, if anyone is interested.

Dave: Lots of projects, so little time and money! The LM373 is for a simple
SSB receiver for 3600-3800. HR in the early and mid 70's had a bunch
of projects using this chip, and I have everything needed to build a
nostalgia
receiver. I have read lots of bad stuff about the chip, how the audio is
distorted,
poor agc, etc, but I want to hear it for myself

Tnx for your recommend of Unicorn Electronics. I bought 1 of the LM373,
several of the 3911 Temp controller chips and some other obsolete IC's
at reasonable prices, just last month from them. Mike's Hobby, Warrenvill,
Il.
had a few LM series chips, and I cleaned them out last week.

All of the 300 series chips are available in big lots through the Evil
Chip-Mongers,
but onezies are difficult to locate.

Thanks for the post, Dave, I'll let the group know how the project turns out

Mike W5CHR
Memphis.

Hey OM:

The only way to do them is to tear them down to the lams re insulate the lams and re stack them.

Only because they put weld shunt shorts on the lams that act as shorted windings, plus the welds hold the lams together, because they don't interweave them.

In the OP's case, the swamping resistor would have to about twice the DC resistance of the choke to get about 2:1 current share between the choke and the resistor. These resistances are typically in the order of a few ohms.

Looking at the ripple frequencies 100/120 Hz and their harmonics, the inductive reactance for 5 H is in the order of kilo-ohms. A swamping resistor of a few ohms would be practically a short circuit across the choke.

I f you can find some of the older ones and they are getting harder to find you can just knock the shunts out with a hammer and punch. I have given some thought to trying cutting the welds out but I havent had a project lately that I am in that desperate of a need of a transformer..

Hey OM:

I grind the shorts off on a grinder with 6 inch diameter grind stones.
Then I have to take the burrs off each lam. All the bear metal has to
be insulated. Then you can make like Tesla and series 3 transformers.
Talk about the air becoming alive. 7500 volts AC will show you how
much leakage there is in the air.

Years ago, to my regret (got fed up with stubbing toes on oversize
door stop) I dumped a 115 volt input neon sign transformer that was
capable (IIRC) of some 15,000 volts?
Great big insulators on each end. Probably a few milliamps output.
Don't see them 'open wired' to the neon signs any more as we did many
years ago?

Hey OM:

Now for the rest of the story: use a high voltage FET 2Amp at 800V across the choke and regulate it with a LM431, programmable Zener. I has a EICO Triband HF rig model 753, it's power supply uses 2 chokes, I regulate the outputs: 790 Volts to the final and 275 Volts to the rest of the rig. Solid as a brick outhouse. The chokes take most of the load off the FET's. So if the chokes saturate the FET's take over. With all the mods I done to the EICO 753's regulating the DC outputs is best.

Ha! Hotmodding an Eico 753. Sorta like putting a supercharger on a
Yugo :-). I can see how both could be fun, in a kinda subversive "it
should've never been sold in the first place, and I'm now going to
take it to the extreme!" sense!

The local skating rink uses them. One toasted a couple of moonths ago when someone splashed it with a milkshake.Fire Brigade was called. I noticed the new transformer has a plexiglass cover . They are a lot of fun to play with. I got my hands on one when I was about 12. I made an electric sword with it and an old automotive radio antenna. Touched my brother on the butt with it. I knew it would shock him, I didnt know he would collapse to the ground .My mother always wondered how I made it to adulthood.

Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/moderated/crossposting
Revision: 1.1 2009/04/12 19:42:04
Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

Would anyone happen to know how a chip like this one: http://cds.linear.com/docs/Datasheet/5598f.pdf ...manages to generate an internal 90 degree phase shift from an LO input over the very wide range of 5MHz-1600MHz? The data sheet says it uses a "poly-phase phase shifter." I'm guessing... some adjustable analog phase shifters (that can provide up to 90 degrees of phase shift at 5MHz) that are controlled by a feedback loop that's looking to null the product of the LO and the (ostensibly 90 degree shifted) LO?

Seems like this is a bit easier to work with than chips that require 2x or 4x inputs to generate their 90 degree LO shifts!

Anyone have a favorite IQ modulator that'll work on 2m (and perhaps 70cm too)? The data sheet's detail of "industry standard pin-out" would suggest that there are others...

Thanks,
---Joel

1GG7-4225?? :-)

Of course, there are others from places like Analog Devices, Hittite, Maxim etc.

I'm not sure how they work, but suppose that something similar to what's used for an audio phase shift network for use generating SSB could be used. At RF frequencies, the capacitors would not be large, and clearly it's not terribly difficult to integrate well-matched capacitors (e.g. in ADC converters). Perhaps I can probe some of my contacts to find out more...

Cheers,
Tom

"I'm not sure how they work, but suppose that something similar to what's used for an audio phase shift network for use generating SSB could be used."

I suspect it's actually something a bit simpler in that the LO is supposed to be one frequency (perhaps with harmonics) and not something that moves around quickly (hence the idea that you can just use a feedback loop and track it), whereas with audio you're dealing with a whole bunch of frequencies at once (in a sense) and have to phase-shift them all 90 degree simultaneously.

I was planning on designing (or at least implmenting -- all the real design was by those filter guys decades back) an audio phase shift network, but since you need an IQ (-like) modulator anyway, and since I already needed a microcontroller for this design, I'm thinking these days it's just as easy to perform a Hilbert transform inside the microcontroller and spit out the audio and it's phase-shifted version on two DAC pins and call it good.

You will find here
http://www.darc.de/distrikte/c/09/Claude/Z-Match.pdf
an article giving more information about the "single coil" Z-Match
circuit. In fact, the "single coil" is actually a coil assembly.

The article is long because it includes many figures.

Has anyone had the idea of (or actually used) scrapped microwaves as
equipment cabinets for home-brew projects?
Seeing a nice small stainless steel one (physically intact) while at
the garbage dump (tip) other day renewed the thought!
Ideas?

I can think of one use if the shields/seals are intact. As a prototype RF
"silence" cage for testing noisy or low noise amps and such. Perhaps that
Hash generating switching supply or bubble jet printer. The fan should help
keep the gear cool.

What would a Steampunker do with one???
This for example:

Posting-Frequency: posted monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/
```

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to rec-radio-info-request@panix.com.

This may be of interest if you are building 13 cm equipment, but since
the seals are usually resonant traps tuned to 2450 MHz, the
attenuation on other frequencies can be quite low.

Hi !
you can save your files in form of PS.
Most PCB manufacturer accept this format also.
Or I can Offer you the service (Only $ 25).
It is also possible to convert PS file to gerber file this will solve
your problem.

Paul: That's interesting  2450 megs being around 12.2 centimetres
wavelength????
I'd alway thought they were just some sort of RF seal along edges of
the case!
Never thought about that whie repairing several except to get the
seals correctly back in place.
Thanks for the comment.
However my original thought was that an old microwave; because
frequently dumped when they go wrong due to a) Cost of labour, skills
and tools are needed for repair, and b) New ones can be bought
cheaply; is a ready made cabinet for some home brew project?

Dear YL's/XYL's and OM's, ;-)

could you give me some hints concerning the listed parts listed under my url http://www.dl8mby.de/eparts/unknownparts.html or better show me a link where to find a data sheet of them.

Many thanks in advance.

Markus

Dear JB,

I will give you some suitable answer concerning some of the mentioned
parts for free, due to the ham spirit ;-)

Part #1: Skyworks 2Gc PIN attenuator.
Part #2: ALPS VXCO (Freq. ?)
Part #3: Delta XCO 19.44Mc
Part #4: Corning VXCO 52Mc
Part #5: probably SAW filter from Temex
Part #6-8: are Filters

In general I know what these parts are, but would like to find some
data sheet when using them in later prrojects as i get not just one
but a big amount of them.

Markus

In the past when working on a synthesized data receiver module with a dead Ref Osc, I spent several hours tracking down such data from various websites in order to find a suitable replacement. Fortunately I had a customer to pay for the time spent because going off the clock would have meant a loss of earnings (and reduced tax contribution). Unfortunately, the company I was contracted with retained the information (or not) and I was unable to because of contract agreements.

The unit was mission critical in the automation of transportation and handling of Mega-Tons of grain for import and export of food staples on a massive scale and time was of the essence or the unit probably would have been scrapped.

I have long noted the value of Ham Radio for dealing with many natural and man made disasters, but the impact of economic disasters seems to have been completely ignored and underestimated. Capitalism has forged a monetary system as a common means of exchange between parties with different skill sets and even of different and widely separated areas and locations. Without a common and mutually beneficial monetary system, we would not have gotten beyond the most basic of trade, instead relying on the hunter-gatherer model even for our water. Those who were able to grow food from their location could not trade very far away because of spoilage, and because it would take them away from tending the farm. Communism must resort to extreme intimidation in order to co-exist with GREED - a common human frailty throughout the World. Indeed, greed is so universal, that it inevitably becomes one of the ultimate motivations in any power struggle. Indeed the naive concept of Communism is impossible because it isn't sustainable, instead morphing into a form of authoritarian exploitation of the productive members of society as a robber class sharpens its skills at deriving support from the productive class, inevitably resulting in slavery of the productive.

An agreed upon world-wide and secure system of exchange is vital to any system of sharing goods, resources, expertise and knowledge.   The collective threats against such a system tends to limit our ability to sustain a widespread and far-flung high standard of living. Although it doesn't guarantee that greed won't have a negative impact, we need to realize that greed isn't something that any system has been able rule out.

So Sir, in the spirit of Ham Radio, do it yourself and enjoy the thrill of your own accomplishment and self-reliance.

Jim

Hey OM:

Nothing like agreeing with somebody that wants $200, then gives us a
lecture on the fine points of the worlds greatest style of gubermint:
communism.
I like trolls they live under the bridge just like me. And trolls
abound everywhere because there's lots of people that like them.
Long live the Queen and her trolls.

Looks like markus gots a load of parts from a cordless phone

manufacturer. Likely they are cordless phones that were made in a
former communist country.

73 OM

Hi Raypsi, ;-)

you are quite right, I got a black box of parts for cheap.
I had separate all the Analag Device beauties from the rest
and looking for data of the remain.

Thanks a lot for halp conversation and entertainment ;-)

Bye
Markus

I have absolutely no idea as to what they are going for now days.

ARC5's that we used to get for just a couple of bucks if not free are
now (in some areas sought after) There is a museum down in Texas that
is rebuilding old aircraft. They have the only flying B29 in the world
that I know of. Another might be the Experimental Aircraft Association
http://www.eaa.org/ They might know of some rebuilders interested and
give you a tax write off.

Of course there is always E-Bay. do a search on ARC-5 and see what
they are going for on there.

I have no idea as to how many of those I cut up for parts 30 or 40
years ago. I do know that the antique aircraft rebuilders are looking
for them.

73 and good luck,

Hey OM:

Nothing like agreeing with somebody that wants $200, then gives us a lecture on the fine points of the worlds greatest style of gubermint: communism.
I like trolls they live under the bridge just like me. And trolls abound everywhere because there's lots of people that like them.
Long live the Queen and her trolls.

Looks like markus gots a load of parts from a cordless phone manufacturer. Likely they are cordless phones that were made in a former communist country.

73 OM
de n8zu

Unfortunately, outside of a small group of experimenters these parts are pretty much worthless. It is difficult enough to market finished products that consumers will shell out for. Very few will decide to conceive of, design and build a useful finished product based on a randomly acquired handful of parts. I actually stopped charging for repair parts so that I won't have to spend so much time and grievous effort into accounting and reporting for a resale license. I simply bid for Labor.

My advice would be to cut and paste specifications and part description and application summary into a text file and put them up on a website and submit them to a search engine for anyone that might be interested. I have noticed that some forums are regularly googled.

We could probably dispense with using the word "communist" because it is just a word. Lets just realize that greed for free stuff can lure us into slavery, because there are people who would make promises to lure the gullible into slavery.

With all the talk these days of "stimulus", it is my bet that most of the money went to buying votes and pet projects that will have no positive effect on economic recovery. It reminds me of Pharaoh contracting obelisks and monuments so that peoples attention will be diverted from building their own businesses, while Pharaoh consolidates his power through building the empire. The slaves will work and be happy for a time, and when the projects reach their fruitless conclusion they will have to look for work again. In my book this is exploitation. Didn't we learn anything from the "New Deal"?

I'm looking for ideas for sliding a ~2" ferrite core in and out of a coil. I've seen ways of tuning over a small range by means of a brass screw used as core. I need smtg better than that, with repeatable positioning and smooth movement.

Some ideas:

- micrometric screw:
use a preexisting screw taken from old depth gauge or bought standalone
PRO calibrated, demoltiplicated, high resolution position readout
CON expensive if new, still need to invent a way to fasten ferrite core to spindle, screw protudes.

- screw drive from scratch:
PRO can be taylored, can use knob with 360deg scale, turns determined by screw pitch - say 0-100 over 360deg @ 20 turns/inch produces 8,000 divisions over 2" linear displacement (if with vernier reaches 80,000), may use knob with turns counter
CON quite complicated to design, may reguire machining and searching for pieces.

- wire drive, like in old radios
PRO can reuse hardware like in old radio, if scale is linear-motion
the tuning indicator is directly attached to ferrite plunger
CON may suffer backlash, hardware disappearing, very short scale.

I only saw very rough solutions, such as gravity pulled ferrite in vertical coil, or using brass screw directly as core for small band coverage. No idea if there's some promising and available type of surplus drive.

Any ideas? Any plans anywhere for DIY? Kits???

(again, I _did_ see use of a small brass screw w/o ferrite!).

R & TIA

Filippo N1JPR

Hey OM:

Microwave ovens are built for a price, the cheaper the better. The chinesse have alot of crap out there. Even the fans are junk. I mean who uses a shaded pole syncro motor for a fan these days, power hungry junk. Best you could get out of a microwave oven is the metal cabinet can be cut up with scissors, that's right, dollar store scissors, will cut the sheet metal they use on microwave ovens. And with a good brake you can make a lot of project boxes.

Well stainless steel project boxes would look sweet.

Summary: Free for shippin
Keywords: meter faceplate, swr sensor

User-Agent: nn/6.7.3
Xref: g2news2.google.com rec.radio.amateur.homebrew:2933 rec.radio.amateur.antenna:13178 rec.radio.amateur.boatanchors:3138

Crossposted to rec.radio.amateur.homebrew, rec.radio.amateur.antenna, and rec.radio.amateur.boatanchors

I wanted a dual-meter voltmeter to mount atop an LDG battery booster to continuously indicate input and output voltages, so I rebuilt an old SWAN Electronics SWR-1A meter and now have the faceplate and the internal SWR sensor unit left over.

I'll mail (without charge in the USA) the faceplate to the first person who wants to restore hizer scratched-up SWR-1A faceplate.

Although it weighs less than five ounces, the sensor unit is obviously a bit bulkier (about 5" x 2" x 1.5") than the flat faceplate!-) It includes two integrally-mounted SO-239 connectors, two diodes, two resistors, two capacitors, the dual pot and its knob, and the really-sturdy sensor (but NOT the two 100 microamp meters which I used in my project!-), all connected as they were in the original unit. If someone wants it, it should mail well and shouldn't take too much postage.

Hey OM:

Brass is the old way to lower inductance. I like to use bismuth the
best metal for lowering inductance of a coil. There's no way that a
low power signal can cut thru bismuth.
And you can increase range by using tapered cone shaped slugs, and
centripetal casting is a lead pipe cinch with bismuth that melts at
271 degrees C.

I got a hold of sum 10 gram bismuth cylindrical slugs for like a buck
a piece. Really sweet for PTO and RF front ends. Depending on the size
of coil you have to match the right N150 to N750 capacitor, to
compensate for inductive temp drift. Or stick it in a small temp
controlled oven.
Or the new age method use AFC or PLL to catch the drift.

73 OM

Something that I thought always looked promising - but which I've
never used in a PTO - are the old floppy drives that used a Acme-style
gear rod driven by a stepper motor to slide the head back and forth
across the floppies. Most 8" floppy drives meet this description, but
only a few 5" floppies did (most 5" floppy drives use a steel band to
do the positioning).

The floppy head assembly had a set of nuts with some anti-backlash
springs. I would think that many of the parts would be quite useful
for a homebrew PTO drive.

Don't knock the "good enough" approach. The crude brass-rod-screw-and-
a-few-brass-nuts scheme used by KD1JV and others for a VFO is really
very usable, especially if you put a big 2" tuning knob on it, but for
portable use a smaller knob works without quite the smooth feeling.
It's not something that will let you cover a 0.5MHz band linearly, but
it will give you very nice coverage of for example a CW-subband.

Tim.

Thank you all around!

I need to make an update.

If one keeps the slug travel requirement to 1" (which isn't bad at all, even for a broad-range PTO) and is willing to use an "outside" micrometer (for thickness/diameter) it's a different game: micrometric screws become really cheap! Bear in mind that repositioning trumps absolute precision, so cheap isn't perforce bad. You can get a 0-1" micrometer for well under $10, i.e. generally cheaper than depth micrometers and in the ballpark for axial slow motion drives with scales.

You can't directly drill holes in the base for front panel mounting, as you can do in depth gauges, but the arch that positions the reference surface opposite to the screw can be cut / drilled and used for securing the device internally. Many models have screw-fastened plastic grips and may not need drilling. Also, by securing it well inside the front panel, the protrusion of the screw can be reduced.

On ebay, this search produces drossfree results:
outside micrometer -electronic -digital -laser -stage -depth -internal
-bore -torque -caliper -lea* -marking

I'll experiment with supergluing a bit of ferrite to a micrometric screw tip with a bit of acrylic dowel in between.

Yup somebody gave me a stainless four section container which appears
to be unused and from an old fashioned ice-cream parlour/soda
```

fountain. There is also a single container, same depth and height etc.
And there is a nice rim around the open ends to which a front panel
could fastened!
Immediately thought of ready-made small equipment cabinets!
Scrapping a bunch of old microwaves is what raised the question of a
reuse for the cabinets. We had a school cafeteria operation one time
with three or four m.waves in use for short periods, on several
occasions was able to scrap older ones for parts for repairs. Now just
junk lying around!

The Nagravision3 Farse Exposed

Uncle Ruport has been a schewd Sat Pirate. His many names were 2old 4this,dexter,squeem well he told me he had 8 guys keeping his 450 pirate sites updated with new files! Nagravision was never hacked it was simply furnished by him to his pirate sat sites to make his goal of owning the satellite empire!

He did so with finess ,after purchasing AT&T he put his oldest son in biz with AT&Tamp and sent him back to Australia,
because of his religous convoctions!

His yougest son Sir James was pulled out of law school at Harvard to fill the void and put in command of NDS.This gave Uncle Ruport free time to exploit the North American market.After becoming an American citizen Uncle Ruport was allowed to buy DTV.
After Uncle Ruport dominated the Satellite biz he started to dabble in the internet of which he owns or has control of everything that goes on his World Wide Webb of deception including microsoft !!

His pirate shops have came a long way from selling timed released files and cards to having a controling interest in FTA/DVB compatible STBs.
His interest in Thompson Electronics and their ability to provide hardware to suit his fancy was merely the tip of the iceburg.He phased the DTV hack out of biz and blamed it on a change in their encryption..This was not reality just technobabble.

Nagravision has never changed to NAG 2 nor
NAG3 because the encrytion was never a danger to satellite PTV. After buying and selling DTV to John Malone there was a binding agreement not to release DTV/DSS files or else he would have to pay dearly.His plea agreement with Canal Plus has given John Malone the upper hand.
The pirates dont know what went on they just swallowed the new encryption farse!

Now Uncle Ruport is full speed ahead now with pushing IKS /DVB boxes .However he has to phase out his so called NAG2..Which is nothing more than dissabling the ppv channels in his files and blaming it on the new NAG 3 farse.
During this dissabling of channels on the current STBs and still offering them on his IKS connection has sent the pirates into a buying freenzy.
His IKS is florishing out of control$$$ He has gone as for as to delete the old files ,back when all the channels were included.So smart people wont realize how he is pushing his IKS connection.
However there is a few that has realized what he was up to and has a stache of old files to fall back on!

and the show goes on

Wheres My $5mil UNK ?

I have an HF transceiver which can be easily modified to work outside
the ham bands. I want to perform the mod so I can use the radio with
VHF/UHF transverters and cover the entire bands. Would this be legal?
I have discussed this with several fellow hams but have not really got
any kind of definitive answer yet.

Jimmie.

Assuming you're in a country where the governing agency lets hams build their own equipment for operation on ham bands, what could possibly be wrong with it? So long as you use modes, powers and frequencies for which you're licensed, and you transmit an appropriately clean signal, who's going to have any problem? You could, of course, get into trouble quickly if you transmit a signal on frequencies you're not licensed to use. Where I am, at least, I can legally build RF power generating equipment for any frequency I want, so long as I don't use it to transmit unauthorized signals. (My RF signal generator is capable of putting out enough power to get me into trouble all the way from kHz to several GHz if I connect it to an antenna, but that's not what I use it for. I've even been using it with a broadband 100 watt amplifier lately, and I'm not at all worried about the legalities, since the power goes into a dummy load where it's turned to heat.)

Cheers,
Tom

As a licensed amateur (I'm assuming US), you can do anything you want
with your equipment as long as you don't transmit outside of the
frequencies and modes authorized by your class of license.

Thanks Tom and Jim, It was also my reasoning that if I could build my
own transmitter and operate it surely modifying equipment would be
legal as long as I did  not transmit outside the bands. The radio is
an Icom and I use software thst I wrote to control the frequency/mode.
It would not be too difficult to modify the software to limit the
frequency data sent to the transceiver in accordance with the band I
am using. The software already  "knows" when I use the transverters so
I get the proper frequency dispaly. As the XYL and YL may be using it
some goof proofing may be in order. Hopefully soon I will also have
the computer controling the switching of the transverters.

Jimmie

This is the basic way many transceivers have worked for many years. The
basic signal generating part is almost never on the same frequency as the
desired output.

As mentioned by others assuming you are in the US anyway it does not mater
what you do to generate the output frequency as long as the final results
are in the ham band and meets the other requirements.

Assuming you are a licensed ham, it is perfectly legal...IF...you do not transmit over the air on a frequency that is NOT authorized. With transverters, the RF coming out of the HF transceiver goes into the transverter on a coax cable. It is not going out over the air. The transverter output must be filtered enough to only pass the desired signal and must reduce harmonics and spurious emissions (of which your IF frequency could be considered a spurious emission).

>Jimmie

The spectral purity specifications in part 97. Most HF rigs have allowed
some out of band operation ever since I could remember. It is the shared
responsibility of the station licensee and control ops to stay cleanly
within their grant. Regular RG 58c provides at least 60db of isolation from
adjacent cabling. Be aware of the possibilities of what might come out of
the antenna ports and take appropriate action. If you waste a little power
in an attenuator and/ or filter circuit on the input of the Xverter,
spurious from the driving radio are also reduced. Nice to be able to verify
with a spectrum analyzer too if you know someone. GL

I did the mod today and it certainly is nice to be able to work the
whole 2M band AM/FM/SSB and CW. I still have to do some cabling when I
go from HF to VHF or vice versa I have some really good coaxial relays
that I could soon rig up to operate manually and hopefully controled
by the PC in the more distant future. The transverter I have was set
up for use with a 10M IF however if I could modify it for a 6M IF
things would be greatly simplified as the transceiver covers 6M at
reduce power(10 watts) compared to 100 watts on HF.

SolderSmoke -- A Global Adventure in Radio Electronics
From Crystal Radios to Podcast MP3s
With Occasional Forays into Astronomy, Kite Aerial Photography, and Model Rocketry

SolderSmoke is the story of a secret, round-the-world, after-hours life in electronics. Bill Meara started out as a normal kid, but around the age of 12 he got interested in radio... To make matters worse, when he got older he became a diplomat. In all of the places he has lived, his hobby caused him to seek out like-minded radio fiends, to stay up late into the night working on strange projects, and to build embarrassingly large antennas above innocent foreign neighborhoods. SolderSmoke takes you into the world of an expatriate geek. It is a technical memoir filled with funny stories and with serious descriptions of Bill's struggles to truly understand the theory behind the equipment that he built.

My intention was to produce a book that is both fun and useful. The memoir part of the book is about my life as electronics-addicted diplomat. But this is more than a memoir: portions of each chapter describe my struggles to really understand the theory behind the circuits that I was building. Throughout, I try to lace the text with inspirational descriptions of the fraternal, cooperative, international aspects of ham radio, of what we call "The International Brotherhood of Electronic Wizards." In short, its the kind of book that a techie would like to take to the beach.

Here is the web site -- it has the cover photo and a preview of the first chapter.

things would be greatly simplified as the transceiver covers 6M at
reduce power(10 watts) compared to 100 watts on HF.

>Jimmie

I certainly like the idea of using the ham rig as a decent general coverage
receiver for SWL and I had to do the mod anyway for 60m operation.  You just
have to get in the habit of looking at the radio to verify conditions before
keying up.  Like checking the swimming pool to see if there is water in it
first.

WInegard makes an antenna-in-a-box, the SS-1000 which lists ~4 db gain over the UHF TV range:

<http://tinyurl.com/nqpzm2>

I must say at the outset that I am hesitant to buy an antenna based on its form-factor, but I'm forced by the local code to not display bare-element type antennae on the mast.

I do like the panel style for the reason that I can arrange 3 around a common mast, aimed at remote cities, and join the outputs for increased coverage.

Has anyone experience with the SS-1000? Or can recommend a similar style antenna?

Thanks.

I've had one on the roof since Dec 2004 in 90274 35 miles from Mt
Wilson split 4 ways with no preamps. It's a fine little UHF antenna

and while they say it can do upper VHF, I have serious doubts. I'll
find out for certain in 2 weeks.

You may encounter some undesired affects from joining antennas. If it
works, fine, but if it doesn't, consider switching among the three at the TV
set(s).

The problem is that the prime signal will be "contaminated" by signal pickup
from the other antenna(s). The degree of contamination may or not affect
reception.

Good luck.

I'm in possestion of 4 LMX2326 PLL IC's and I'm looking for projects
to use them in.

I was thinking of building and designing an RF Signal Generator but
I'm confused about the VCO. Is it possible to use the LMX2326 to drive
a VCO built up of discrete components or do you have to work with an
VCO IC like the ones from minicircuits?

Thanks, G, for answering the question *asked*. I appreciate it. :-)

The issue re. rights may be interesting to some, but was not asked. (Man, the signal-to-noise ration on USENET is *so* low...)

If you think of it, please post a follow-up in 2 weeks.

Thanks.

I believe what Elmo says is correct.

Check out: http://www.fcc.gov/mb/facts/otard.html

which says, in part:

The rule (47 C.F.R. Section 1.4000) has been in effect since October
1996, and it prohibits restrictions that impair the installation,
maintenance or use of antennas used to receive video programming. The
rule applies to video antennas including direct-to-home satellite dishes
that are less than one meter (39.37") in diameter (or of any size in
Alaska), TV antennas, and wireless cable antennas. The rule prohibits
most restrictions that: (1) unreasonably delay or prevent installation,
maintenance or use; (2) unreasonably increase the cost of installation,

maintenance or use; or (3) preclude reception of an acceptable quality signal.

In this ruling, the FCC pre-empted not only state and local government regulations but HOA CCR's and landlords' restrictions on renters.

This came about because the broadcasters have a strong lobby, and they didn't want widespread limitations on receiving their over-the-air or satellite transmissions.

I asked a question. I didn't ask Is my assertion correct? Assume it is (regardless FCC mandates).

You (and others) decided to answer an unasked question.

But let's not drag this on. I'd like to hear from anyone who has used this antenna or other like it.

Thanks.

Hey OM:

Sure discrete is ok, you are going to use GaAs fets i assume? The
caveat is feedback the correct signal level to Fin or NOT>Fin.

Hey OM
This si just a rehash of another post awhile back in this here forum.
But DTV will never go away so:

I seen one on youtube, there are a tonne of them, but this, to the
best of my recollection, one used:

1pc 1x2 2ft long board
5 steel wire coat hangers
dry wall screws
and a 75 ohm to 300 ohm balun

to make a 4 bay bowtie antenna

Ideally that's 6 db over, just a single bowtie.

And an 8 bay bowtie would be 9db.

I the real world it would be slightly less

Capture area of stacked antennas is greater, so less UHF fading. Like
when the wind blows trees branches around and when cars and trucks go
by.

But nothing like watching a pixelated picture. Unless you got a good
memory in that set box.

4dB isn't very much gain. Compare this with some other available antennas:
<http://www.hdtvprimer.com/ANTENNAS/comparing.html>
Unfortunately, the SS-1000 and SS-1000 are not listed.

Depending on the distance between your apartment and the antenna location, the +4dB antenna gain may not be sufficient to compensate for the coax loss. Are you in a weak signal or strong signal area? Is an antenna amplifier justified?   If so, you might need 3 amplifiers for your 3 different directions.

Also, a 4dB gain antenna will not have a very directional antenna pattern or be particularly directional. My guess(tm) is perhaps 120 degrees wide. There probably won't be much difference in signal strength if your 3 directions are within the beam width.

>I must say at the outset that I am hesitant to buy an antenna based on its
>form-factor, but I'm forced by the local code to not display bare-element
>type antennae on the mast.

As others have mentioned, this is mostly incorrect. The problem is in the interpretation of the word "unreasonable", which might be interpreted in a variety of ways. Without details on your situation, I can't comment on this.

>I do like the panel style for the reason that I can arrange 3 around a common
>mast, aimed at remote cities, and join the outputs for increased coverage.

Mast? Welcome to "unreasonable". The FCC 47.1.4000 clause that limits antenna installation has nothing to say about the supporting structure. While the HOA may not be able to prevent you from installing an antenna, they most certainly will have something to say about the design and construction of the supporting structure. They may also demand that it be installed by a licensed and insured installer to protect themselves against subsequent litigation. I know you don't want to hear about all this, but methinks you should at least be warned before blundering onward.

>Has anyone experience with the SS-1000? Or can recommend a similar style
>antenna?

No recommendations. Antennas are sized and designed to solve specific problems. The design required in a strong signal area is quite different from one in a weak signal area, in an urban canyon, for an indoor installation, or if it is intended to be disguised or minimalized. It's also important to know the lowest VHF frequency or channel that the antenna is expected to operate as this has a huge effect on the physical size of the antenna. Without a clue as to your situation, it's impossible to offer an endorsement or alternative. If you find it inconvenient to disclose such details, I suggest you use:
<http://www.antennaweb.org>
to optimize your selection and proposed installation.

Seeing that you are forced into this, you will suffer by the same degree. In comparisons to others in the field, it is good by technical standards - for UHF (low VHF is just hopes and dreams). In comparisons to others in the field, it is mediocre by cost standards.

So you suffer in cost and coverage (if you want VHF); and form factor is always going to reign.

This should come as no surprise, certainly.

>Or can recommend a similar style
>antenna?

To suffer equally? As you really lead with your chin ("local code" and hewing to not arguing that line) and don't offer any technical specifics (where you live, what stations, what directions, what distances, what bands, what frequencies, what height mast - in short nothing) you might fill a 16x16x4 inch box with low denomination bills, attach a cord and see how that works. If it doesn't, then send the cash filled box to Winegard and ask that they fill the box with an antenna in return for what they find inside. It may work equally well.

Sorry for the lengthy answer that sums up to "maybe," short questions often require even more elaboration to upgrade to "perhaps."

> Al, the usual

Hi Al

The gain of an antenna is related to its radiation pattern shape.
When the signal ois divided between several antennas, the "gain" of the system is lowered.

For instance, when the "gain" of the antenna is the result of its directuivity being restricted to 180 degrees azimuth, and the second (identical) antenna is mounted to cover the other 180 degrees, the "gain of the both" is 3 dB. lower than the gain of either antenna alone.

If the "remote cities" produce signals that are weak enough that you are required to have antenna gain to receive them, you may need a switch that disconnects all but one antenna for channels from that city.

You're right, it isn't very directional but it has a reasonable front-
to-back ratio.

All I can say is I've been using Winegard antennas since 1974 and have
found them to be well built good performers and have never been
disappointed with their products. Also, any friends who took my advice
were never disappointed with either the antannas OR me.

Isn't that like swimming in a cesspool?  Isn't that the most polluted of
the Great Lakes?  I live near Lake Superior...water looks clean but it's
damn cold (but the icebergs do give you a nice place to get out and rest
on the swim from Ashland (WI) to Thunder Bay, Ontario) ;)

Sorry, typo error. I mean't the SS-1000 and SS-2000 (amplified). It
does list the "Sharp Shooter" which is a different indoor antenna.

What's inside the SS-1000 and some really weird "gain" tests:
<http://www.hdtvexpert.com/pages/squareshot.htm>

>As I said, I use it 35 miles out from Mt Wilson (Los Angeles) and have
>it split 4 ways - no preamps. I do have Line Of Sight (just barely)

Yes, but the original poster may not have such an ideal location.

Also, bad guess on the beamwidth. It's 54 (channel 69) to 95 (channel
7) degrees. Sorry.

>You're right, it isn't very directional but it has a reasonable front-

>to-back ratio.

It varies with frequency. It's only 2.6dB at channel 10. See specs below.

>All I can say is I've been using Winegard antennas since 1974 and have
>found them to be well built good performers and have never been

I try to avoid shopping by brand. Even the best manufacturers have their lemons and losers. Right now, the advertising trend is to replace your existing antenna with an HD or Digital TV antenna, whatever that means. Also, to make it look like a DBS dish, which is generally accepted by most HOA.

Specs and details:
<http://www.winegarddirect.com/pdf/spec_ss1000-ss2000.pdf>
<http://www.winegarddirect.com/squareshooter-ss1000-ss2000/winegard-square-shooter.htm>
<http://www.winegarddirect.com/viewitem~p~ss-1000~d~Winegard-SS1000-SquareShooter-UHF-Only-DigitalAnalogHDTV-Antenna-System-(SS1000)~post~.htm>
I don't see much to complain about in the design and construction of this antenna. However, whether it's suitable for the OP's location and application is unknown.

TV Fool azimuth plot:

<http://i44.tinypic.com/2a4wghx.jpg>

Was considering 3 antennae with wide reception angles pointed generally at
45, 140, 310 deg. Only 3 are LOS (15, 18, 33)

Pretty flat terrain, no tall structures nearby . Top of the mast: 14 ft. agl.

Thanks.

I don't expect it to be usable where I'm at for channels 7,9,11 and
13. I'll try it and if / when it fails, I'll tie in the VHF of the
Winegard in the garage eaves. Hopefully its VHF performance will make
```

the grade under the roof 'chaff'. If the wife would put up with the
all channel garage antenna on the roof, it would certainly be fine BUT
she doesn't want to look at it, hence the SS-1000 at least for the
UHF.

You won't find any new Sony at our house but you will find 4 Gigabyte
motherboards with AMD processors, 3 old Technics receivers, 8 Advent
speakers, Canon cameras and a lot of who knows what. When one of the
brands falls short I'll re-evaluate but for now I'm happy.

That one is all over the internet. It works OK, but you would
get better results with copper wire, not steel coat hangers.
It also looks ugly.

For another idea, do a google for a Hoverman style antenna.

Then there is mine...

Nice plot. Kinda looks like you'll need a rotator. The -3dB
beamwidth varies from 54 to 95 degrees. At best, 3 antennas will
cover 3*95 = 285 degrees. At worst, 3*54 = 162 degrees.

>Was considering 3 antennae with wide reception angles pointed generally at
>45, 140, 310 deg. Only 3 are LOS (15, 18, 33)

What are the ranges and approximate signal strengths? Looks like 18
and 33 can be covered with one antenna pointed at about 250 degrees. A
second antenna at 45 degrees *MIGHT* catch the largest number of
channels. However, there's no optimum location for a 3rd antenna to
catch all the remaining stations. You'll probably have to pick and
choose among the relatively strong ones and take what you can get.
With a UHF only antenna, stations 2-13 are problematic (or
impossible). If you're going to run multiple antennas, you'll
probably need an antenna switch, 3 tower mounted amplifiers, and 3
coax cable runs. If you try to combine then with a power splitter,
you'll get interaction between antennas and an ugly and unpredictable
pattern.

With an indoor antenna of any sorts, which ones can you receive
(including the weak ones)? With only 4dBi of antenna gain, I don't
think you'll be able to dig the ones you can't receive out of the
noise.

>Pretty flat terrain, no tall structures nearby . Top of the mast: 14 ft. agl.

They let you have a 14 ft mast and you're worried about the antenna police? Might as well go for broke. Install a real yagi antenna, tower mounted amplifier, and rotator. For the tower amp, I recommend a Channel Master 7777.
<http://www.channelmasterintl.com/amplifiers.html>
For an antenna, whatever you can find. The bigger and uglier the antenna, the better it works. See specs at:
<http://www.hdtvprimer.com/ANTENNAS/comparing.html>

If you're not sure, buy just one antenna, hang it out the window on a broom stick, and see what it does. If you're close, continue with your proposed ideas. If it looks hopeless, give up before you burn any more money.

I would suggest it came about because cable operators have a strong
lobby and wanted to be deregulated.  The FCC was reluctant to do so as
long as many apartment- and condo-dwellers had no choice but to
subscribe to cable.  By ensuring these people have access to OTA TV you
ensure (at least in theory) that if deregulated cable rates get too
high, one can switch to OTA or satellite.

=========================================

Either way, Elmo is indeed correct.

Hi, Gordon,

I recall when you introduced your neat handiwork to the group. I meant to ask a question:

Did you ever try connecting each of the antennas' twin lead to its own separate balun and combine the 75-ohm sides of the baluns into a single coax? A passive splitter, connected backwards, performs this function nicely.

I ask because, as you have your antenna wired (two antennas in parallel to a single balun) looks like an impedance mismatch; the balun wants a 300-ohm connection to the two screws and two 300-ohm antennas at the same time would be 150-ohms. I think you previously said you are not a techie, so forgive me if I'm using terms you don't know.

Not being one to argue with success, if you tried it and it wasn't any better, then more power to you. Rock on!

"Sal"

PS: For my fellow techies: Yes, I realize the 300-ohm figure for a bowtie is nominal and the actual impedance will differ from that figure. Paralleling the two antennas could be superior.

```

No, I didn't think to try that. I could give it a shot, I have all
the necessary parts. I am concerned about loss, and thought that
the extra hardware would introduce too much extra loss.

I'm following you.

Hmmm... Yes. I can see how there could be a mismatch. But I
thought that only applied to simple things like resistance in DC
and AC circuits. RF is not one of my forte`s.

Anyway, I was trying to mimic the Channelmaster two and 4 bay
bowtie designs, that seem to have a 300 ohm feed.

Maybe someone could explain that.

>

Well, I got an improvement, probably in spite of myself. The
setup gives better signal strength, and is less suseptable to
interfearence (people walking aroung the room) than just a
single bowtie.

I'll be using FET transistors, or experimenting. It's a learning
project anyway since I'm heading into microwave terrority next year
for my Master' degree. And I thought I'd get a head start by building
and designing some projects such as PLL driven VCO.

I'm now just looking for a good book on oscillator design. Any
suggestions?

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

A mismatch can cause ghosting in an analog TV.
What does ghosting do to a digital TV signal?

If its bad enough it will wreck the reception. But the latest
processors can tolerate multipath that is only 1 db down.

They are getting better as they try to debug HDTV for mobile reception.

It puts 'ripples' into the passband. The ripples happen because of
phase cancelations. The ATI HDTV Wonder cards can handle variations to
around 8-10 dB. After that it just freezes up.

Near the bottom of the page in the link there is an example of the
ATSC spectrum. Add random dips into it.

http://www.hdtvprimer.com/ISSUES/what_is_ATSC.html

Your worst nightmare. From 10 years ago:
<http://www.businessweek.com/bwdaily/dnflash/aug1999/nf90826b.htm>
(Note the sales predictions, which were totally wrong).
All DTV chipsets now have ghost elimination circuitry, which does a
good job of reducing multipath problems. There's a spec for it but
I'm too lazy to look.   Here's the patent:
<http://www.google.com/patents?id=XNp3AAAAEBAJ&dq=7038732>
with references to others in citations. I won't pretend to understand
how it works.

The FCC website has quite a bit of info on interpretation (from various regulatory and legal actions) of what is and isn't unreasonable. Paint color: reasonable, restrictions on location: unreasonable, restrictions on form of antenna: unreasonable.

>
>> I do like the panel style for the reason that I can arrange 3 around a common mast, aimed at remote cities, and join the outputs for increased coverage.
>
> Mast? Welcome to "unreasonable". The FCC 47.1.4000 clause that limits antenna installation has nothing to say about the supporting structure. While the HOA may not be able to prevent you from installing an antenna, they most certainly will have something to say about the design and construction of the supporting structure. They may also demand that it be installed by a licensed and insured installer to protect themselves against subsequent litigation. I know you don't want to hear about all this, but methinks you should at least be warned before blundering onward.
>

Hah.. go look at the case of Stanley and Vera Holliday.. 5 masts 30 ft high, multiple dishes and antenans...

In countries using COFDM (DVB-T), the symbol time is about 1000 us
(8k) or 250 us (2k), so in the worst case with minimal guard
intervals, you can still use mismatched coaxial cables longer than 1
km without problems :-).

With ATSC 8VSB it depends how well the equalizer is capable of
detecting the characteristics of the radio and coaxial path with a
known signal pattern.

This is true to a point.  Local codes no problem, BUT in HOA territory
these rules do not necessarily apply. In most cases the HOAs have
modified their rules. The small direct satellite lobby started the
trend.  Allowing these dishes they really had to include other TV antennas.

Hey OM:

That's rich, a hacker putting a SIP program that can access a VIOP
stream then somehow miraculously transduce the SIP VIOP into acoustic
energy out the back of his computer.

All those programs you need a sound card and speakers or headphones. But hey maybe the hacker is using the modulating the case fans to make audio out the back of his computer.? He didn't say the voices were coming out his speakers.

How else is audio voices coming out the back of his computer? And through out his house? He sure doesn't have SIP VIOP software in his CD player?

Just tell me how to get SIP VIOP software into my cd player?

It's not uncommon for AM radio or CB to be induced into wiring and
demodulated simply by rectification. The result may be strong enough to
activate computer or stereo speakers or the little transducer on dial-up
modem cards or even metal flashing in the house.

FWIW, I've been using FreePCB for layouts the past year or so, and find it's pretty well documented and easy to use. It produces Gerbers, and of course you already know that once you have those, you can find lots of different places to order boards, some faster than others, some cheaper than others. I do end up having to build footprints for FreePCB fairly often, but even that's not too bad, and once built, I have them for the future.

Cheers,
Tom

Actually it was blocking of a radio transmission by ships passing on a
river that led to the development of radar.

Great. Thanks for the input. One other thing. I have a buddy who was looking
for a free Gerber editor for making minor artwork changes. He had some
boards done outside and needs to make some changes to fix a few boo-boos
when he did the design. You know of any? He only has Windows. I run Windows
and Linux so either would work. I could make the changes for him.

Well, I'm using ViewMate from PentaLogix. I don't do anything very complex with it, basically just view my FreePCB outputs to make sure everything is OK. I also use it to print the Gerbers for assembly documentation and to make my own boards at home--I like the immediacy of being able to make a board in an hour or two. ViewMate's free... BUT it won't let you save changes. You have to spring for the upgrade to ViewMaster EZ for $50 to be able to save (and do some other things). There may be free solutions, but since ViewMate does what I need, I haven't gone looking for them.

For fixing boo-boos, I'd a lot rather go back to the PC design program
and make the changes there, rather than hand-editing Gerbers, but I
suppose there are good reasons to modify the Gerbers directly. I do
recall some hassles trying to get my layout program do what I wanted
with a solder mask recently, and was really tempted to try to modify
the Gerbers!

Cheers,
Tom

RF blocking was used by both sides as a "burglar alarm" to detect
naval vessels passing through narrow straights. Germany tried to get
such a system working across the Straits of Gibraltar, but were foiled
by Spain's failure to cooperate.

Radar was officially "invented" in 1935 when Watson-Watt was asked by
the air ministry to calculate the possibility of using RF as a "death
ray" to cook an airplane pilot in flight. Some calculations were
performed which quickly determined that it was impossible. However,
he suggested that a similar system could be used to detect the
airplane by combining the range finding of ionospheric layers
techniques and the direction finding techniques used to detect
thunderstorms. At the time, there were also proposals for aircraft
detection using infrared and sound detection. Not wanting to lose
their funding, it was agreed that RF reflection was a good idea and
that research should continue on this different path.

Agree with all of that. Even 'back when' stories abounded about people
picking up radio transmissions on all kinds of unlikely devices; one
was about a lady who 'received' faint radio signals radio on her
electric heater. The outcome was that a corroded connection was acting
as a detector (like in an old time crystal radio set) the coiled
heating element was an inductor and the metal case of the heater was
a sound box! When it was investigated she said she "Didn't mind a bit
and in fact thought it was quite entertaining"!
Today there are so many solid state devices around any home that one

wouldn't be surprised if one could 'hear' things from a ceiling fan,
dimmer switch, or certainly something with audio amplification such as
computer speakers!

The Pulsonix software I use has can import Gerber files and edit them,
but it isn't free.

Tom;

I understand your points. My buddy does not have access to the software that was used for the layout. That's why he wanted the Gerber editor.

What I have found so far is a free (GPL'd) Gerber file viewer, no editor.

http://gerbv.sourceforge.net/

There are both Windows and Linux versions available for down load. It has a few bugs but so far as a viewer it works remarkably well.

>What I have found so far is a free (GPL'd) Gerber file viewer, no editor.

How much editing do you want to do?

Gerber files are just text. You can edit with a normal text editor.
As long as you have a good viewer you can see if your edits did what
you want.

Hal;

May have to reroute a few traces that cross a significant length of the
board to fix some design errors. I haven't looked at the raw Gerber files to
see how easy doing the editing by hand word be to do.

You have a rough idea as to the cost for the bare-bones PCB core? I didn't see any prices on the web sites from a quick look..

Ah, I forgot about that issue.

So, any _other_ PCB layout program that coughs up a Gerber.  Or be
careful of what you copy into your schematics.

It's not the length that matters but the number of segments.

I didn't mean to suggest that it would be simple. It would take
a bit of trial and error to get going. You would probably have
to find some specs for the gerber file format.

I'd probably do the routing on paper and then transfer it to
the gerber file. The important point is that you can use the
viewer to show what you have so you know if you got it right.

Hal;

I'll suggest that to my buddy and see if he has any luck. I didn't consider trying that method. The board he has is about 10 by 12 inches, double sided with around 40 through hole chips on it with several dozen discrete components sprinkled around them. That could get very interesting.

Thanks for the suggestion and this may be what he will have to do. The free Gerber viewer I found will come in handy for checking the results as you pointed out. I'm sure I can find the spec's for the Gerber file format on line some place so that shouldn't be a problem.

Thanks;

Leland C. Scott

```

Hey all,

Many years ago (Late 80's) I was given a variety of radio equipment
from a gentleman I knew. He was going to new guinea as a missionary
and gave me a bunch of parts/projects/stuff.

I have identified one of the (transcievers?) as an ARC-5. Also there
is at least 2 more of these in parts, maybe more. Also a bunch of
variable capacitors (the air-core metal finned ones) and various tubes
and coils and other random stuff.

This stuff has been sitting in my attic for 20 years, slowly
collecting dust and corrosion. A long time ago, I was going to get my
general class license. I never took the test, and just don't have much
hobby time anymore.

Does anyone know if this equipment is worth identifying and posting
somewhere for sale/trade? And if so, where would I find people
interested in this stuff?

Thanks in advance :-D

rec.radio.amateur.boatanchors newsgroup. The ARC-5 is a WWII era
aircraft radio as I recall.

It doesn't have many features that a purpose-built "Gerber editor" does, although it certainly works in a pinch. (The biggest problem seems to be that Pulsonix tries to be smart and figure out what things "are," whereas sometimes you just want a "dumb" editor that thinks of everything as a drawn line or a flashed shape.)

Protel used to have very good Gerber import abilities... I wonder if it still does?

> You have a rough idea as to the cost for the bare-bones PCB core? I didn't see any prices on the web sites from a quick look..

That almost always implies at least four digits. :-)

You pretty much have to call up your local Pulsonix distributor to get pricing -- it tends to vary significantly worldwide. As of a little more than a year ago, any Pulsonix suite that included PCB layout was >$2k in the U.S. A full-featured suite with a handful of the "spendy" options (network licensing, database connectivity, chip packaging toolkit, etc.) would tend to top $10k in the U.S.

The usual practice of widows and estate liquidators is to donate items left over from auctions to a local club to sort out.   Most will be taken to swap meets where most items of interest will fall into the right hands. As an alternative, post group photos of items on a web site and post the links here and in boatanchors newsgroups and allow interested parties to ask about items via e-mail address set aside for that purpose.

Lots of stuff is only museum interesting, but some that you described, continues to be useful for antenna matching and other projects. Radio is still RF and laws of Physics are still valid and some parts would always be useful.if in good shape. Corrosion is only appealing on art objects and yard ornaments.

Joel,
    I would counter your comment below. True that Protel can import Gerber
but it is specifically a very limited Gerber import that works mainly only
with it's own exported Gerbers. Try importing Gerbers created in another
toool and you are fighting a difficult if not loosing battle. There are all
sorts of legitimate Gerber expressions that it will just gag on.

--
Sincerely,
Brad Velander.

Hello,

Can power supply filter chokes be used beyond their stated current
ratings? Are they typically rated for continuous duty? If so, if used
in ICAS service can I draw more current than rated?

For example, I have a choke rated for 5 Henries at 400 MA (25 Ohms).
I'd like to use it in a circuit drawing up to 650 MA peak. This would
be for a class C amp -- CW only.

Thanks for any input.

73,

You're proposing to run the choke at more than 150% of its current rating.
That will have at least two very adverse effects.
First, you could overheat the windings to the point of burning insulation on the windings, burning the wire open, causing a fire, etc.
Second, you're running the very possible risk of saturating the core, causing major loss of inductance. The effect this would have on your circuit depends on its actual component values and how well the rest of the circuit can forgive the loss of inductance.
My recommendation would be to get a choke of the appropriate ratings.

That said, you should download a copy of Duncan's power supply designer from http://www.duncanamps.com/psud2/index.html and input your component values, load it with a stepped constant current load and see how it performs. This program will show you the current and voltage waveforms and values, but it won't show the core saturation effects. You'll need more sophisticated software for that (Spice).

Cheers

..edited for brevity..

Thanks for the reality check.  It was wishful thinking on my part --
based on some hazy recollection of running transformers in ICAS service
beyond their CCS ratings.

> That said, you should download a copy of Duncan's power supply designer from
> http://www.duncanamps.com/psud2/index.html

Thanks for the information, Brad. When I was using Protel's Gerber import functionality, it was only with Gerber files Protel itself had generated, so I never saw the important limitations you're describing.

Joel,

Glad I could enlighten or warn.

Plenty of users only find it out after their expectations are raised. The first one that I stumbled across was that it wouldn't even import some Protel Generated files that had been re-exported from their own Camtastic 2000DE after a couple of very minor edits.

Some externally generated Gerbers may be formatted much closer than others to the precise format required.for Protel import. I have heard of a couple people having success with only edits to the initial Gerber configuration statements (approx. the first dozen lines). That wasn't the case in a couple of my attempted imports, the required edits grew exponentially as I tried to progress.

--
Sincerely,
Brad Velander.

> That will have at least two very adverse effects.
> First, you could overheat the windings to the point of burning insulation on
> the windings, burning the wire open, causing a fire, etc.

People need to think about the duty cycle of CW. The 400 ma rating of the
choke _should_ be for CCS and that _should_ mean 100% duty cycle. Figure
out yourself what the duty cycle of CW would be: a string of dots would be
50% duty cycle. A string of dashes would be 75% duty cycle. The other

question would be, for CW, what is his key up resting current going to be compared to 650 ma (at peak)?

You have to think how much a choke heats up under its rated CCS current.

Hes got a choke with 25 ohms, so put a DC voltage accross that to get a current of 650 ma and feel the choke with your fingers every 4-5 minutes. Or get a thermometer and touch the bulb to the case of the choke and watch it to see if the temperature comes up to a plateau (it should).

Quite frankly, I think its a _go_ project.

More below.

> Second, you're running the very possible risk of saturating the core,
> causing major loss of inductance.

That would depend entirely on whether the core had an anti-saturation air gap somewhere. As far as I know (and there was one curve in QST decades ago on this), all chokes have an inductance which has some relationship to current. When I was a kid I built a magnetic amplifier (and it worked) based on variable inductance in one winding controlled by variable current in another winding.

If this choke is going into a power supply and you are worried about whether such currents are going to hurt your voltage regulation, then you can hook up an oscilloscope (through an appropriate dropping voltage divider) and go ahead and key the current.

There are a lot of high power amplifiers that don't even use chokes in their power supplies, but put in extra capacitance.

Of course, if you are a purist-perfectionist, then go and plunk out the money for the bigger choke.

If it were me, I'd consider the criteria I mentioned above, do the DC current experiment (one at 400 ma and one at 650 ma) and see how hot the choke got. When chokes and transformers get a little overheated, they may smoke or give off fumes that you can smell, too. If you let the thing keep smoking, then after some time you will start to damage the insulation and wax impregnated paper layers.

A 25 ohm choke would need a little under 12 volts to get the 400 ma, and maybe somewhere around 16-19 volts to get up to around 2/3 of an amp. That will end up (without doing the actual arithmetic) being about ten watts of heat to dissipate. Don't forget that the actual duty cycle will be 50-75%, on CW, so your choke at 650 ma intermittent service is probably going to be dissipating heat as if it were close to the 400 ma CCS operating conditions.

I still think the project is a _go_.

```
   The effect this would have on your

Hi gang,
I'm looking for any information regarding converting pll type cbs to 10m.
Specifically I picked up a couple of Cobra HH33 handhelds and it looks like
a simple reference oscillator xtal change along with a new 2nd oscillator
using the orignal pll rock will get these things somewhere on 10.
Ideas? Web sites? Books?

Thanks!

Bob

Years ago (probably in the 70s), there was a flood of CB chassis on the surplus market from Hy-Gain, a major manufacturer that was going out of business. There was a number of magazine articles in 73 Magazine that went into excruciating detail on the CB-10M conversion. I never did one, but as I remember, it was a matter of changing crystals and some minor retuning. Don't remember if there were any component changes necessary, but if there were, they would likely be in the tuned RF circuits in the receiver front-end and in the transmitter final stage.
Take a look here (http://www.cbcintl.com/pllbook.htm) and you should get a pretty good idea on how to do your radio. If your Cobra is a recent model, the PLL might be completely different than the old PLL02 chips, but the theory should still be the same. There's also a doc on CB to 6M conversion at http://6mt.com/index.php?option=com_docman&task=doc_download&gid=21&Itemid=53.
First thing I could recommend would be to see if you can find a schematic for your radio. That would allow you to do the math on the crystals and how they mix to make it work.

Cheers,

Changing the reference oscillator will change the channel spacing so
be careful here if you want the 10 meter channels to be 10 kHz apart.

I remember these. They were pretty trivial to convert to ham use. Actually almost all of the CB radios of that time period used identical circuit boards - except for the Tandy/Radio Shack models. In radios with an automatic noise limiter or noise blanker, for example, they just stuffed in a few more parts on the same printed circuit board. I remember taking the covers off a $600 rack-mounted radio (Dak) and showing the disappointed owner that inside it was identical to a $39 radio!

One local club even built a 10 meter repeater. Since it is relatively trivial to add FM to a transmitter, the repeater was FM-IN and AM-OUT. Those Hy-Gain/Uniden/Cobra/Midland/etc. radios were used with a varactor diode added to the transmit chain. The repeater used separate sites for the receiver and the transmitter instead of a duplexer. It worked quite well.

Dave gave some good advice here. I do not know if it is true of modern CB radios, but in the late 1970's, manufacturers started using bandpass crystal filters in the transmit chain instead of a set of 3 or 4 tuned circuits to clean up the mixing products. This filter had a secondary purpose too - it prevented the radio from tuning very far from the original CB channels.

If the choke ratings are actually CCS (and not ICAS as many were/are), I would go for it. If it doesn't quite work out, and the smoke bothers your eyes, there is another easy solution. Since this is about homebrew, it is a relatively simple project to rewind a choke (except, horror of horrors, a potted choke). Use a little heavier wire. Since there probably won't be enough

room for as many turns, you'll lose a little inductance, but who will know
the
difference? A little hum on a CW signal is quite distinguished anyway.

Great little receiver. Nothing that needs any apology. I've just become
more focused on my HB Kitchin receiver and hate to see the Scout sitting
here without a daily walk.

No problems with it. I sucked out the 'kit building' factor so I'll go
less than the retail price. 35 USD sound ok? Plus shipping, call it $5
in the US.

I think most chokes today are rated for continuous duty. However, check with the manufacturer to be sure.

With respect to heating the choke, you can run higher current if you keep the rms value down to the choke's rating. To do this, you should have a duty factor as follows:

400 mA = 650 mA x sqrt(D) where D is the duty factor you must not exceed.

This gives (.4/.65)^2 or a duty factor of about 38%. (Can CW be sent at this duty?)

Expanding a bit on Dave M's comments:

Inductance at the higher current might be more problematic. As the iron gets closer to saturation, inductance takes a nose dive. This will cause higher peak currents which invalidate the above calculations because the higher peak currents mean higher RMS. This higher RMS current might also be bad for your filter capacitors. The only way to know for sure is to measure the true RMS choke and capacitor currents at the desired load current. You could then adjust your duty factor to not exceed the choke's rating. Then check the filter capacitor's RMS rating to see if it is exceeded. High RMS capacitor currents cause heating which dries out the electrolyte thus reducing the capacitor's life. Also check your ripple voltage to see if it is tolerable. Do all this without overheating the choke.

Good luck with your project.

John - KD5YI

Trying to clear out some 'junk' but have always tended to keep scrapped parts from old (UNREPAIRABLE/NOT-WORTH-FIXING) microwaves!

e.g. the transformers, fans, fuse holders, overheat switches. And even occasionally have used some of them for repairs to other microwaves!

I applied 115.7 volts AC to what had been the HV winding of one of these scrapped transf. recently and got about 6 volts on what had been the original primary. That established the ratio between the two windings as approx 20:1.

Also a small voltage (about 0.185 volts) across what had been the magnetron (Approx. 3 volt?) heater winding. Which gives ratio of about 1:33 to the original primary winding; also a ratio of about 1:700 from the original HV winding.

So the idea of using the transformer backwards comes to mind????

Depending on the unit they are typically rated as follows?

Input winding 115 volts at whatever total wattage of the magnetron circuit is. Assume say 1000 watts requiring about 8.7 amps primary current! Usually intermittent use.

The original HV secondary operates at around 2200 volts, so 1000 watts (ignore the magnetron heater current for a moment) would average about 400 to 500 milliamps? And pretty peaky because of the half wave high voltage doubling circuit???

More moderately; at 115 volts and say 400 m/a into the old HV winding the transformer might be able to supply around 6 volts at around 5 to 7 amps from what used to be the 115 volt primary?
Or at 115v/250 m/a maybe 3 to 5 amps? For 6.3v heaters?

Alternatively could such an ex-microwave power transformer be used in the plate circuit (non-push/pull) of an audio amp using say a 6v6 or 6L6 (perhaps triode connected?) with a DC plate current of 45 to 75 milliamps?

Thus in such an arrangement the 20:1 ratio to the original primary could provide something of a match for an 8 ohm speaker? (20)^2 x 8 = 3200

Problems; the laminations of such transformers do not seem to have air spaces as in some audio transformers carrying DC? The bottom (neutral) end of HV winding is sometimes at cabinet 'ground'. Hence a problem; unless the transformer is isolated and even then the transformer frame could be 'hot' whenever the unit is plugged in if that winding now used as the primary! Therefore unsafe.

Have also heard of cutting off the old HV winding etc. and using the remainder of transformer to make battery charger; down rating a typical transformer to say 500 watts (continuous) for battery charging

that's sort of around 30 to 40 amps at 12+ volts. Not sure what the
turns per volt would be but should be possible to poke a few turns
around the partially stripped core until one gets around 14 to 15
volts RMS.

This is all supposition at this stage! Any comments criticism????

Seems there are quite a few uses for them!

Other uses:

good:
http://www.rhunt.f9.co.uk/Electronics/Spot_Welder/Spot_Welder_Page1.htm

Neat, but not so good - has he never heard of screening mains supplies?:
http://www.youtube.com/watch?v=Wp7JF2sANsw

Sheesh - doing this over large metal sheets with live mains involved an apparently zero mains insulation / isolation box / separation. Would *LOVE* to see his kilowatt linear; but perhaps not:
http://www.instructables.com/id/Build-a-Microwave-Transformer-Homemade-Welder/

Your concepts are good, and if you do google searches on "microwave oven transformers" you will get websites that talk about their experiences.

I did buy a couple of used microwave ovens at local thrift stores for $5 each and played with the big transformers inside.

I was not satisfied with the result. One of the things some of the websites talk about is that you have to remove the "magnetic choke" that is part of the core. This needs a good hammer and a "punch" and was much harder to do for one transformer than another. And, after taking it out, it still did not perform.

The problem I found in both of my transformers is that at low voltages and a reasonable load, it was fine, but from about 50 volts and on up to line voltage into the primary, the primary current went up much faster than it should have considering the load that I put on the transformer secondary. I do not know what kind of load magnetrons put on power supply transformers but i suspect it is not like a continuous load. I tried to do google searches on magnetron current-voltage relationships but could not find anything. Certainly those "magnetic chokes" must be doing something.

In the end, I wound up buying my plate transformers at hamfests and also one, new, made by Hammond in Canada. Peter Dahl is out of business, and Ameritron (I think) will sell plate transformers and some are reasonably priced for the power and voltage. Fair Radio Sales (Lima, Ohio) and Radio-Daze (NY) are two that sell Hammond transformers, including large plate transformers (many types, specs all over the map, too).

Well, yes, Peter is out of the business, but the transformers and other
items are still being built to his specs:

<http://forums.qrz.com/showthread.php?t=153611?

<blockquote>
Peter Dahl Company has NOT been sold. It is NOT moving across the border
to Mexico. Gary no longer works for the them. The Peter Dahl Company has

stopped production, is closing their doors, and will become part of Amateur Radio History!

But the NAME lives on!

Jeff Weinberg, W8CQ of Harbach Electronics, has purchased the rights to the name, the original transformer and choke specifications and designs, and the design equipment.

The transformers will be built by MagCap Engineering using the original PWD specs, and sold through Harbach Electronics under the Peter Dahl name. The transformer and chokes will be FOB Canton, MA and shipped directly to the customer from MagCap.

This is great news for the Amateur Radio Community and a great way to memorialize the Peter Dahl Company who's innovations and designs have brought so much to our hobby.

To nullify any further rumors or innuendos about the status or future of the Peter W Dahl Company, let me share the following e-mail with you (edited for content)...

Quote:
Re: Harbach Electronics and Peter Dahl
From: "Jeff Weinberg W8CQ"
Date: Wed, February 20, 2008 2:30 pm
To: "Dino Darling"

Hi Dino,
Yes, the deal is finally completed. I have purchased all of the transformer
designs and design equipment from Peter Dahl. I am moving the equipment here to Ohio. Once all of the computer design work has been updated and cataloged, I will be selling Peter Dahl transformers and chokes.

I should be up and running in a couple months.

(snip)

MagCap will be building the transformers according to the original Peter Dahl designs and specs and will be sold by Harbach Electronics under the Peter W. Dahl name.

Regards,
Jeff Weinberg W8CQ
Harbach Electronics

http://www.harbachelectronics.com
I've heard great things about Jeff and his company from people I know and respect. To me this is a great day in Amateur Radio and I look forward to the future with Peter W Dahl firmly rooted in our hobby!

They are a great source of a core and primary for DIY transformers. Thes transformer were designed as a constant current source and have magnetic shunts that must be removed for most power supply applications

Jimmie

Thanks for the info. It goes beyond what came out in QST at the time and that was that production was going to end, period. There was no hint at all in the QST anouncement that there was even any possibility for continuation.

Before I come down with CRS syndrome, I'd like to complete some
projects started in the early 70's. (!!!!!) Looking for National LM300
series IC's,
ie LM371, LM372, LM373, LM375. If you have any of these critters in can or
dip package, and they need a new home, email me with details please.
Cheap is great, free is even better.

The only part that I could find anywhere was the LM373 at
http://www.unicornelectronics.com/IC/LINEAR.html. They have several other
LM3xx ICs on the list, but none of the parts you're looking for.
Your projects might be DIW if no one has them in their junquebox. What are
your projects? Might be a workaround for some of the unobtanium parts.

Cheeers

You SHOULD know better, Elmo. There are some restrictions an HOA can
place on a homeowner, but they are few. Here is a link to the FCC site:
http://www.fcc.gov/mb/facts/otard.html

  the FCC premption (aka OTARD rules) is the key thing here.. The HOA
can't really do anything if it fits in the FCC guidelines.. dishes <1
meter, OTA TV any size.

Nice thing about the Winegard SquareShooter is it resembles a dish
though my neighbors might think I don't have a clue how to aim it.
It's opposite where all the little dishes are aimed. They would have
laughed if they had seen the spectrum analyzer on the driveway next to
the car. I was on the roof with binoculars to see the screen.

  It will suffer phase distortion. In the good old days we called that
"ghosting", now it will be signal drop outs!

When I lived in Miami; there was a subdivision in Miami Lakes that had
banned TV antennas (before the FCC ruling). A homeowner had constructed
some form of "artwork" with a TV antenna in front of his house. It was
positioned toward the sky, unusable, but unmistakably a TV antenna!

I'd like to find a small battery powered wireless device that I could
install on a mailbox that would send a signal when the box is opened.
I'd install a set of contacts to either open or close, and have the
monitor in the house about 100 feet away. Any ideas appreciated.
Thanks
Hank

Just google "wireless mailbox alarm" and you'll get tons of choices.

Hey OM:

Nothing like a book to use for information like this.
I would point you to Electronic Design News. The monthly rag that has
plenty more up to date articles and information with footnotes.
There's cornucopia of info just in the footnotes alone in every
article.

I remember one article, I like to catch so called knowledgeable people
with: a modulation domain analyzer. Nobody ever heard of it, one of
the best tools ever invented. Is what an spectrum analyzer is to a
time based sweep scope: as the modulation domain analyzer is to a
```

spectrum analyzer,

73 OM
de n8zu

I'd say there are some good oscillator design books out there, and
there are also lots of articles from various magazines. "RF Design,"
"Microwave Journal," and "Microwaves and RF" all come to mind. I know
that Ulrich Rohde has written some good articles on the subject. He's
also written books on the subject, like "Microwave and Wireless
Synthesizers." Dunno how good the book is, but I do respect the
author. Seems like I have some photocopies of decent VCO articles out
of "Wireless World," too.

Continuing the basenote drift: Dunno if it was ever marketed
specifically under the name "modulation domain analyzer," but the the
HP89410 series of Vector Signal Analyzers is extremely good at that
sort of thing. The Agilent 89600 series is likewise very good at

complex analysis tasks.

Cheers,
Tom

Cheers,
Tom

A book that was recommended to me just a couple weeks ago is "RF and Microwave Transistor Oscillator Design", Grebennikov (Wiley, ISBN 0470025352). I haven't ordered a copy yet, but the recommendation came from a very knowledgeable designer.

I just bought that book by Grebennikov not 24 hours ago. I've quickly
scanned it through and it's a worthwhile addition to the library. It's
a little heavy on the math but has great examples and design
exercices. A serious knowledge of transistors and electronics is
required before starting in this book. Biasing and S-parameters aren't
explained (references given though).

And PCB layout isn't handled either, this is something of a drawback
if you ask me.

I'll be on the lookout for Ulrich Rohde's book.

I have been getting sounds in our house that seems to come from electronic stuff around the house.
I also listened to what sounded like voices coming from behind the computer?

We as a Family are stumped. We have written Bell Canada as well as call there teck support, They don't understand what voice over ip provider?

Someone has mentioned that this could be happening to get into banks , homes, anything really. If you hack could you please tell me how to fix this.

As we said we are stumped?
Thanks
Dave

Do you use dialup, with an internal modem? Modern telephone systems helpfully give a voice message for a busy signal. This would come through the sounder unit on the modem card: voice in the computer!

Voices coming out of loudspeakers or other electronic equipment which contains them, can occur as the result of strong radio frequency signals. A strong enough RF signal, modulated by someone's voice, can be picked up by the household wiring (mains cables, telephone wire, speaker cables, etc.) and leak into the electronic equipment. Once inside the equipment, it can be accidentally "detected" (converted from radio frequencies back to audio) by semiconductors in the circuitry, amplified, and played out through the equipment's speakers.

Telephones, answering machines, baby monitors, powered subwoofers, computer speaker systems, etc. can all be prone to this. I suppose that an internal modem card in a PC - one with a loudspeaker - could pick up enough RF via its phone-line connection to start detecting audio in this way.

The strong RF signal might come from any of a number of sources... all probably fairly close to the house. Commercial AM transmitters can cause this, as can ham-radio transmitters, and CB radios. Here in the U.S., *legal* CB transmissions usually aren't strong enough to cause problems, but some CB operators use illegal high-power amplifiers that can boost the signal far enough to cause this sort of inadvertent pickup.

I don't know what the law is about this sort of problem in Canada. Here in the U.S., the FCC generally considers it to be a defect in the equipment which is picking up the RF - if a device isn't *supposed* to be a radio, it shouldn't *behave" like a radio, is their thinking. It's referred to as "undesired operation", and the "Part 15" notice which comes with most consumer electronic devices says that the device "must accept radio frequency interference, including that which causes undesired operation."

There are several ways to address the problem:

- Replace the RF-sensitive devices with better-designed devices that don't have the problem.

- Add RF filters or chokes to the phone lines, speaker cables, power lines, etc. to block the RF before it enters the equipment.

- Find the person or company whose transmitters are generating the RF, and ask them to stop (they'll probably refuse, as they often have a perfectly good legal license to transmit).

- Live with it.

- Move.

If you can find which pieces of equipment are picking up the RF (and, in doing so, confirm that this is the problem) you can likely correct the problem with some clamp-on ferrite chokes, and/or a telephone-line RF filter (a DSL mini-filter may well do the job).

See http://www.palomar-engineers.com/RFI_Kit/rfi_kit.html for a kit of ferrite components specifically intended for this sort of household problem.

I'm not sure what connection there might be between the voices/noises you are hearing, and any "voice over IP provider". Your message isn't clear whether you actually have telephone service over IP, or whether you think someone else's voice-over-IP service is affecting you accidentally (very unlikely, in my opinion).

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

 radio/personal-intro
 Subject: Guide to the rec.radio Newsgroups
 Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
 Last Posted: 9 Nov 2001 06:18:17 GMT
 Posting-Frequency: 15th of each month

We are willing to provide any technical support necessary to get this
article updated and automatically posted again at a regular interval.
This would include establishing contact with the original maintainer for
any necessary permissions. We would prefer to seek a new, dedicated
maintainer at this time, rather than start auto-posting the original
article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

Please help me to solve my omni-d problem.... It lost 90% of the receive side.I can barely hear signals that were usually 30 over 9.but what gets me it is that I flip the switch in the back to "receive" instead of leaving it in the transceive position and use the receive jack(not the pl-259) and it receive normally.I opened it and checked the relay(contacts) and they are ok....I took a wire antenna and jumped it to the "input signal pin" of the rx mixer and the reception cames back....any ideas guys.......

I have been considerring modify an Astron 30 amp power supply to work at 26 volts. I was thinking maybe I could do this by changing the half bridge rectifier to a full bridge unit. Replacing the caps and modifying the regulator circuit. I want to use the power supply to power some 24 volt equipment and also maintain the charge on a 24 volt 100 amp/hr battery. I shamefully admit that I havent done much research on doing this but was hoping someone else already had and could save me some work.

Jimmie

I used to own an Omni D 546, and I did have some problems with it, but not a receive problem but an email to TenTech, got me going in the right direction, and actually the manual that is supplied gives a huge amount of info on fault finding etc. Perhaps you could try to find a copy?

How did you check the relay contacts? My neighbor, now SK, had one with a problem that sounds like yours and it was the relay. You cant always tell just by looking.

Well OM:

Maybe and maybe not.

A battery charger IC would be a lot better than a regulator, like a
MAX713, which is for NiMh batteries, or the UC3906.
So if that's from scratch I guess you are right.

Sounds like a lot of work. Have you considered buying another Astron supply and operating them in series?

Astron supplies can be used in series (double the voltage) and some in parallel (like the PS-50, double the current).

Dave,

Give us a little more information:

- are the sounds continuous? or only happen at certain times of the day?
- is it really voices? what does it sound like?
- "seems to come from electronic stuff around the house?" What kinds of stuff? Only the PC?

- do you hear the sound even when the "stuff" is turned off? Some very strong signals can by heard through stereo speakers even if the stereo is not running.
- "coming from BEHIND the computer?" In other words, not from the computer's speakers but somewhere else on the computer?
- How is your PC connected to the Internet: dial-up over phone lines? Cable TV modem? Phone company DSL?

A few troubleshooting hints:

Some people living near Radio or TV stations can hear those stations in electronic devices (phones, stereos, computer speakers). IF the sounds are continuous, that may be the source.

If the sounds are not continuous, but only heard once in a while, the sounds are more likely coming from some intermittent source. Perhaps a taxi cab or trucking company radio, a local CB or Ham radio operator... something like that.

Can you actually hear a voice, or does it sound like "Donald Duck?" If the voice is intelligible, it is more likely a CB operator running AM (amplitude modulation, the dominant mode on CB); whereas if it sounds like "Donald Duck" talking, it may be a Ham Radio running SSB (single sideband, the dominant mode on amateur radio).

As Dave Pratt mentioned in his excellent reply, there are ways to filter out unwanted stray RF energy.... but first you need to understand the source and how/where it is getting into your "stuff".

In my opinion, there is no way that VoIP (Voice over IP) could cause this problem... for a whole bunch of geeky reasons. You need to look somewhere else for the culprit.

You can likely bypass the entire regulator and pick off 25 v raw from the
filter bank.  First thing to do would be to get the schematic.  You would
start by removing the regulator/crowbar anyway and swap in a perf board.  I
don't know what the voltage rating is on the filter bank though.  Schematics
are one page simple and out there on the Net.  There are some other  mods
out there with descriptions.  It is just a 723 comparator.

Grab the Schematic, ands start looking where the Transceive Input and
the Receive Only Input connect and then follow the Transceive line back
and test each component clear back to the connector.... You will likely
find it in the contacts, but it may be a PIN Diode Switch, or T/R Relay
problem depending on how the radio was designed...

http://www.qrpkits.com/scoutregen.html

I received mine and got it assembled this afternoon. Pretty nifty little radio and easy to build. No problems at all. The instruction manual gets an A+++. They did short me one part - A 1 meg/1/4w resistor.

I had just started my Kitchin rcvr when this one came out. After a few days of counting my coins I decided to go for it. Figured it would be fun to compare with my homebrew.
http://www.arrl.org/tis/info/pdf/95hb1768.pdf

The little rig works great. Frankly I think the front end is better than mine. Mine was crippled without a BCB trap to notch out my local station. This one has no trap and the local is not a bother. It also seems like its not as prone to overload as my circuit.

I thought the no-vernier tuning capacitor would be a big annoyance but its not so bad. The electronic fine tuning works great and the regeneration behaves well. I'm no fan of little tiny knobs but what the heck.

Gonna do some review on the front end of mine now that I see it could be better.

The kit gets a thumbs up from me. Total assembly time with the coil winding, decals, etc was about 4-5 leisurely hours.

>>A mismatch can cause ghosting in an analog TV.
>>What does ghosting do to a digital TV signal?

  Just as a point of interest (to me at least) I grew up within 3 blocks of
an airport, it
was a several times a day occurance to have the picture flutter as an
airplane flew by.
                                                 Mike

hey OM:

I know the fix;get about 100ft roll of chicken wire. around your
computer built a small closet sized room with a door all from the
chicken wire. when you bring in the power lines put emi filters and
hash filters on the AC line. when bringing in the coax cable to the
modem put clamp on ferrite filters over the coax. use the shortest
possible lan cable to the computer from the modem. and then make sure
you ground the chicken wire to a good cold water pipe

another thing voip phone service can't be demodulated with anything
but a voip box. the modulation techniques they are using can't
demodulated  except with a voip box. And when they are in RF form the
cable modem has to demodulate the cable signals.

I wonder why people feel compelled to repost an offensive article in its entirety just to complain about being offended.

BS... there are plenty of Computer Apps that can demod VoIP streams,
and None of those are VoIP Boxes......

Why complain here (and even quote the offending message again)? The spammer does not even read the newsgroups he posts to, so your complaint just wastes bandwidth. Why not learn to read the message headers? Then you can complain to system administrators who just might shut the spammer down. I always include Google, but I have yet to ever see them do anything.

In this particular case, I sent a complaint to:

Re: brutemann@gmail.com (Apparent email address where the spammer wants return mail)
    To: abuse@google.com
        groups-abuse@google.com

Well, it's the 'big day' and while we have an excellent antenna at work, I didn't think the little 'SquareShooter' would be adequate for VHF-hi (channels 7-13) DTV. I brought home the spectrum analyzer to check out the signal before I tried a re-scan. So far 2 of the 4 VHF-hi have completed the change over. KABC-7 and KCAL-9 are in their new homes. The spectrum analyzer showed better than 20dB carrier to noise which should be OK. I then connected to the computer tuner and it works very well. I must say I am totally surprised about that as the analog stations 7-13 were SO weak as to not even SEE a locked umage from analog. As it is, it appears to be as good as the UHF DTV. If Fox 11 and KCOP-13 are as good as 7 and 9 I won't need to change a thing.

G=B2

news:24d3eea0-2907-4cb1-a26e-2135cfe48e4b@y9g2000yqg.googlegroups.com...

So far 2 of the 4 VHF-hi have completed the change over. KABC-7 and KCAL-9 are in their new homes. The spectrum analyzer showed better than 20dB carrier to noise which should be OK. I then connected to the computer tuner and it works very well. I must say I am totally surprised about that as the analog stations 7-13 were SO weak as to not even SEE a locked umage from analog. As it is, it appears to be as good as the UHF DTV. If Fox 11 and KCOP-13 are as good as 7 and 9 I won't need to change a thing.

=======================================

I got KABC but, so far, no KCAL. I'm in San Diego, so my situation will be variable, depending on the ducting. I think I've lost KCBS, since they moved to KCAL's old channel, 43, which has a local LPTV station sitting on it. I still have some more antenna tricks to try. KCAL on 43 was always very "iffy."

I've also lost KCET; There's a Mexican station (full power) on 28. KOCE generally good.

My optimism was premature. KABC is better than I expected and KCAL was
marginal. KTTV-11 Fox is way down in the mud and KCOP-13 is worse than
11, neither of which is usable at all. Keep in mind this is that
little SquareShooter (without the preamp) which is good for UHF isn't
going to make it for VHF hi. Oh well, some more cable along with a UHF/
VHF splitter (combiner) and that big Winegard in the garage will
hopefully cure it.

At 12:30am 6-13-09 KWHY-22 analog was still on the air but all that's
left are a few low power analogs - as they told us.

Dummy me, I just remembered KWHY is one of the LA nightlight stations
that will stay on another month with an infomercial on how to get your
TV converted.

By this little snippet of what was intended as an aside may, in fact,
be your solution for VHF.  Given your predicament of "code" (arbitrary
or otherwise), you can put the cable to work.

The solution is called a "Franklin Antenna."  It would be disguised as
an antenna cable (or telephone cable, or power line, or other
innocuous wire) that trails up (to something innocuous), but never
connects (who is going to look?  and if they did, it could always be a
dummy connection).

A Franklin antenna is a stacked, gain antenna that is very colinear
(hence the cable motif).  These are most often described on the Web
for home wi-fi or bluetooth applications, but with scaling you can
bring them back down into the TV VHF band.  A quick search gives:
http://www.para.org.ph/membersarticles/DU1ANV/
Development%20of%20Collinear%20Antennas_Matching%20and%20Feeding%20Techniques%20-
%2021.pdf
which on page 11 gives a pictorial representation (I can't say I vouch
for the entire paper, but it is representative of the topic).

Does anybody have or know where to get a utility to convert from ExpressPCB
file format to a standard Gerber file? If not any info on the file format
itself?

Yup. You can pay Express PCB for the file. (No utility) $75 the last time I
bought one.

That's not going to happen. I know I can get some reverse engineering software that will import the layout as a graphic then trace over it using the PCB layout software to generate standard Gerber files. I'm looking for something easy and I'm not paying them $75 a pop for each small board to convert.

I also found out there maybe some utilities out, still looking, there that can convert from an exported PDF, or EPS file, to a Gerber format too. Getting a PDF printer driver is easy. Use the driver when printing out a copy of the board layout.

The only problem is that a Franklin antenna is usually vertically polarized. TV is horizontal.... well some station have a vertically polarized component, but it's mostly horizontal.
<http://www.tvtechnology.com/article/68820>
The Franklin antenna is not very wide band, covering perhaps a few UHF channels, but certainly not the entire UHF TV band.

Topic drift: Franklin or AMOS antennas for Wi-Fi. NEC2 deck is under the "main" page and is easily scaled for your favorite TV channel.
<http://802.11junk.com/jeffl/antennas/AMOS-7/index.html>
<http://802.11junk.com/jeffl/antennas/AMOS-5/index.html>

I don't have photos of the "disguise" TV antenna I installed on top of a 175ft redwood tree. It was vertically polarized, crammed into a PVC pipe, and filled with urethane foam (fence post compound). 20dB gain wide band GaAsFET amp at the base. It was painted brown, to match the tree trunk.

Performance was a disaster. There wasn't enough gain so most stations were noisy. With an omnidirectinal pattern, it did a superior job of converting reflections from the surrounding mountains, into obnoxious and irritating ghosts. 4 tries, and no luck.

The plan was to install a pully near the top of the tree, and use a rope to raise and lower verious experiments. Unfortunately, I used a rope that did not do well in the sun. After about a year of trial and error, the rope crumbled. The pully is still in the tree and can probably be used again.

As for other disguise antennas, I've done some tinkering characterizing various road signs for operation as antennas. The aluminum sign is a tolerable radiator, but the galvanized steel support is a problem. I've also seen all manner of urethane sculptures, designed to resemble a tree, cactus, building materials, lamps, boulders, etc, each with an antenna behind or inside. Also fiberglass panels for hiding antennas in the sidewalk.

I've also crammed wi-fi repeaters inside a plastic owl. I've disguised a wi-fi antenna by making it look like a giant bird nest. If the neighbors asked, I told the owner to tell them it was a Roc nest.
<http://en.wikipedia.org/wiki/Roc_(mythology)>
For HF, I've loaded into the rain gutters, installed chicken wire under the carpeting for a ground, and strung wires between telephone poles.

Reverse the "Express" and the "PCB" and you'll find a really nice little company that will take Gerber files and make boards for you. Eagle PCB is free for small two-layer boards, includes schematic capture, and works well once you get your brain wrapped around their way of doing things.

I hung the spectrum analyzer on the Winegard all channel antenna in
the rafters of the garage. The VHF channels are strong and free of
response 'bumps' (meaning no serious multipath) and the UHF may be
better than the squareshooter on the roof. Tomorrow I shoot a hole in
the stucco wall to get the new RG-6 coax (crazy guy at Torrance
Electronics sold me 100 ft for $9) pulled in to the splitter to feed
the computers and STB. It looks like it will be good.

Use Advanced Circuits. Their PCB Artist software is much better than
Express PCB's (it's actually a special version of Easy-PC) and you get
the Gerbers free with a second order for the same board, IIRC.

It was identifying the reflection of radio signals from a flying
aircraft that led to the development and use of radar.
Radar was major factor in the successful defence of Britain (Britain
1940) against German bombing (The Blitz) early in WWII (1939-1945).
Although it was initially very crude, (It was called Radio-location or
RDF, Radio Direction Finding) at the time.
Unfortunately the first war time US use of radar was misinterpreted
when the Japanese attacked Pearl Harbour  in Dec 1941!

I'm going to check them out. I do some small one-off PCB's to test some
ideas out. I would like to have the Gerber files when I'm done in case I
want to incorporate it in a larger design.

probably 20, 15, and 10 meters but "mikea" has the right idea,
suggesting you try a SWR analyzer on it.

> 2- What about those ground planes? Are they necessary?

Yes, probably. (there were some vertical antennas designed that don't
need them but this doesn't sound like one of them) Usually with a
vertical antenna, the ground plane is half the antenna - to put it
differently, if you don't put up the ground plane, half the antenna is
missing.

> 3- On the dipole, I have a 1:1 balun in the garage, should I use this

If you're center-feeding an antenna with ladder line then I don't think
there's any need for a balun at the antenna. And if your tuner has a
balanced output for connecting the ladder line, then you don't need a
balun at the shack either.

It would be more useful if you were using coaxial cable to feed the dipole.

With three traps, and with the size, they are likely traps for 10, 15, and 20 meters. This would make the antenna a 4-band antenna. The traps act like open circuits at their resonant frequency. At frequencies below the trap's resonant frequency, the trap acts like a loading coil. So this vertical would work on 10, 15, 20 and 40 meters. The antenna sounds like a Hy-Gain 14AVQ or its clone.

>> 2- What about those ground planes? Are they necessary?
>
> Yes, probably. (there were some vertical antennas designed that don't need them but this doesn't sound like one of them) Usually with a vertical antenna, the ground plane is half the antenna - to put it differently, if you don't put up the ground plane, half the antenna is missing.

You will need a ground plane for 40 meters (about 33 feet), 20 meters (16.5 feet), and 10 meters (8 feet 4 inches). The wires for 40 meters would be resonant on 15 meters, the third harmonic. Allowing the radial wires to slope down at an angle will raise the feed impedance slightly. With the proper end insulators, they can assist in guying the antenna. The shorter radials can be hung below the longer radials using some CPVC pipe to separate the two a few inches.

>> 3- On the dipole, I have a 1:1 balun in the garage, should I use this with the dipole? The antenna tuner already has some device to balance so is it necessary for the other balun? Someone told me it is so I must ask.

>
> It {the balun} would be more useful if you were using coaxial cable to feed the dipole.

Do not worry about the dipole being absolutely straight. Since you fed the dipole with ladder line, a balun at the antenna is not needed. The vertical should be fed with coaxial cable.

Using the dipole and the tuner alone will let you operate from 80 through 10 meters. There will likely be some interaction between the dipole and the vertical so tune the vertical with the dipole in place. Even if the dipole is in reality an inverted-V, its radiation will be predominantly horizontal, while the vertical will be, you guessed it, vertical. Having both a horizontally and vertically polarized antenna will allow you to switch to the one giving the best signals.

The TR-7 is a nice rig. You should enjoy using it on the HF bands. Have fun...

Thanks for the info

Yes, that is the Hy-Gain 14AVQ antenna I have. I found the owners manual online.

http://www.hy-gain.com/man/pdf/AV-14AVQ.pdf

I will have to find someone locally to test each trap, its an old antenna and I want to make sure they are operational before I put it up. It will go on a tower about 50ft. No way I can put the gnd planes up there as the manual recommends.

The manual says its a dead short over the input termenals so I can measure
that but I don't have a resonance tester.

Thanks

I rebuilt some trap antennas many years ago and the main issues were simply minor mechanical things. Corrosion or loose sheet metal screws.

I'd suggest giving it a good mechanically-minded workover and you'll probably be good to go. I recall on my KLM beam that some of the plastic 'end' boots had deteriorated within just a few years so be wary of those plastic parts.

The bigger issue here would seem to be the ability to adjust the antenna. The dimensions are not necessarily "plug-n-play" and even in the best of situations with tuned radials may require some adjustment. It can work on top of a tower without the tuned radials but WILL require

some adjusting of the lengths unless you just want to accept it as it
happens to fall. Managing a vertical like that the top of a tower is an
exercise in physics leverage-wise and its no fun to do it multiple times :(

Yep.  It was the head-butt-style jerks and the cesspool environment
on 75M and 20M that drove me to check out 6M some 12-13 years ago.
I've never looked back.

Amen brother...When mobile, I use 17M if I need to be on HF. Otherwise, I am like you...I have 6M through 1296 plus 10 GHz now. Well, actually, I just finished up building the 1296 transverter today and did a quick checkout on the TX side...only 2 mW...should be about 20 mW, so I have to check into it, but I'm busy finishing up the checkout of a customers 1296 unit today so I can get it shipped to him (I built it for him).

Hi All,

A friend has acquired several Hughes 8781AH Klystron Amplifiers (from
AML-STX-141 transmitters).

The tubes apparently will generate about +45dBm at 12GHz from -2200V,
waveguide is WR75 / WG17 (10-15GHz)

Can anyone help with further information about this tube please.

I am interested in knowing the bandwidth (will it run at 10GHz).

Fire extinguisher and change of underwear are available for the first
powering up...

Thanks,

Mark

This is the DVD every CB or Ham Radio Operator has been looking for who likes to build their own Amplifiers.

1 to 16 Pill AMP Designs...................

http://cgi.ebay.com/Linear-Amplifier-Plans-1-16-Pill-On-DVD_W0QQitemZ200332937473QQcmdZViewItemQQptZLH_DefaultDomain_0?hash=item2ea4c60901&_trksid=p3286.c0.m14&_trkparms=72%3A1234%7C66%3A2%7C65%3A12%7C39%3A1%7C240%3A1318%7C301%3A0%7C293%3A1%7C294%3A50

Description

Item Specifics - Item Condition
Condition: New

This is the DVD every CB or Ham Radio Operator has been looking for who likes to build their own Amplifiers.

1 to 16 Pill AMP Designs

Step by Step directions

Full Schematics

Full Color Pics of step by step build of each Box 1-16 pill

Full Parts List for each Design

And most important were to by all the parts you need is included.

This DVD makes it very easy for the Novice to build their Own Box

This is just plans we are not selling anything but plans on how to build these units and its for Educational Purpose only.

No Returns or Money back.Each DVD is checked before they are shipped to make sure they work 100%

Not to worry...it states the plans are for educational use only!  ;)
Maybe it would be good for CBers to build high voltage amps if you get
my drift ;)  Just kidding...they're people too...

heya fellas,

I recently took apart an old radio. My interest in radios has been growing for the past few months. The only problem is that I have no where near the funds required to set myself up with even a decent portable radio. Anyway, back to this radio. It was probably made in the late 80's to early 90's. It says its a Bluapunkt Sabre 90... Does this mean anything to you guys?

It is almost a standard radio, except that it can handle SW. Now, when I opened it up, I noticed 3 coils of wire wrapped around some sort of a tube. In my brain, im think that these 3 coils are for the 3 different frequency bands! So, now this gets me thinking, maybe I can make some different coils, and so change the frequency band? Is it that simple, or is there something more to it? I really want to listen in on our nearby airport at 121.9MHz... I think.

Are there any websites that I can visit to help aswell.

Kind regards,

Patrick

Sounds like you are describing the ferrite rod internal antenna. The three coils might be LW, MW or 1-2 shortwave bands.

These are actually coils for the antenna input stage for those lower frequency bands. The equivalent "FM" coil is likely going to be a little tiny thing of several turns mounted on a circuit board.

Thats only half the story. There's also a set of oscillator coils for each band....maybe in little square cans or out in the open.

The quick answer is no, this isn't a simple modification. Many of us (me included) have done such things :) so I can't say its not possible but you would be much farther ahead maybe building a little Aircraft band converter kit of something of that nature.

Just my 2c

Also, if I remember correctly, aircraft use AM in the 108-136 MHz range.
So modifying the 88-108 MHz FM portion of the receiver wouldn't work.
And modifying one of the lower AM/SSB bands to work on VHF would be quite
a stretch.

Doesn't really matter much since you can slope tune it.

It's been a long time since I did it, but isn't slope detection for
receiving an FM signal using an AM receiver?  This is the reverse
situation.

IIRC, slope tuning can be used to allow an AM receiver to demodulate
FM (albeit somewhat crudely).

Does it work in reverse? Can you offset-tune an FM receiver, and get
its discriminator to demodulate an AM carrier-and-sidebands?

Seems to me that this wouldn't necessarily work... the
huge-amounts-of-gain-and-then-clip-the-result architecture of an FM's
IF strip is going to equalize out the amplitude variations in the AM
signal pretty effectively, won't it?

If an FM radio has a decent amount of limiting forget about receiving
FM but if the limiting can be removed or it doesnt have too much you
can receive AM on an FM receiver thought it may be fairly distored but
it most likely will be copyable. For example I have an ICOM two meter
FM transceiver that will tune the VHF aircraft frequencies. Sorry
but I forget the model # at present I bought it about 15 years ago and
havent tused it in 10 years.

Jimmie

Hey OM:

Back that far they been using PLL for FM demod. Only because they

needed to demod stereo phase, at 15 some Khz. Find the slope in that
PLL and it'll detect AM. But most osc's in those things are only good
to 110Mhz, with 10.7 Mhz IF, that'll get you to 120.7Mhz You just
can't make the capacitance of the circuit go away with a coil.
If you are lucky the airport your near will be within 108 to 120.7 Mhz

You might as well just build a converter, like back in the day when FM
first came out they used a converter to take 88 to 108 MHz and put it
on the AM band. All you did was plug the box into the antenna of your
AM car radio and viola' FM and with a reverb you could even simulate
stereo. That was b4 8 track tape decks.

Heck I made a living making and selling a converter for police band
453Mhz to AM radio band you could actually tune 4 police channels in
the Detroit, MI USA area with the converter and any AM radio. We used
a CB crystal for the oscillator multiplied it up to 452 Mhz and viola'
police band on any AM radio. the converter was the size of a pack of
cigarettes.

This link will give you an idea now a days things are a lot easier:

I remember when those things were around. There was a group of my
friends who like to do a little street racing so we used it to keep up
with where the police were. We also used CB radio to talk to each
other. When we found out the police were on to us planing races on CB
we got where we would pass the mike around and pretend like we were
having a race and watch them run all over town. The things we had to
do back then to keep intertained.

Jimmie

I am looking for a 6 to 1 balun, 300 ohms balanced to 50 ohms coax. I don't need one that handles transmitter power as I am only using it for a receiving antenna.

I have on hand several hundred feet of 50 ohm coax, RG58 modified (IEEE 802.3). I want to use it to connect my 300 ohm TV dipole antenna in my attic to my HDTV in the basement. And, of course, I would need a 50 ohm to 75 ohm match at the HDTV.

We only watch over-the-air TV. Why? Because I live within 2 miles of three 1000 ft TV towers. In fact, the dipole in the basement works quite well. But I do get dropouts during storms; go figure. I get 17 channels for free, so why go cable or FIOS. Nothing worthwhile there anyway.

So can someone point me to a good site for balun design. I've done the Google searches, but all that I find seem to be for high power applications.

Any help would be appreciated.

```

Have you tried the 50 ohm cable directly (with a 4:1 xfmr at the dipole)
to see how it works? The 300 ohms for the dipole, etc only apply at one
single frequency and with signals that strong there really shouldn't be
an issue with additional loss. Reflections will not show up visibly
with digital tv.

Part of the issue here is winding the balun and set transformer at UHF
frequencies. Not impossible to do with inexpensive parts (multicore
ferrites) but I wonder if its really necessary?

GL,
Bill

Yes, just go ahead and use a normal 4:1 off-the-shelf TV/FM balun. They
are only a couple of dollars. The effects of the incorrect impedance
transformation will be negligible, and there's little to be gained by
trying for 'perfection'. If it doesn't work, you've lost virtually
nothing. [Note that, if it doesn't work, it won't be because the ratio
is wrong, or that the coax isn't 75 ohms.

Yes, I thought I might try that. You guys are right. It should not be an issue at these signal levels. I have a bunch of the 4:1 baluns that I have gotten from our town's recycling station.

But it is still odd that I get dropouts when I am so close to the towers.

Al

That might well be due to multiple off-air reflections. Digital TV isn't
totally immune to the problems these cause (but, of course, you don't
see the reflections like you do on analog TV pictures).

Even if you live in an area of high signal strength, it's often
necessary first to get a clean signal from the antenna, which may need
to be a 'high-gain' design in order to reduce reflections. If you've got
too much signal at the TV set, you can always fit in-line attenuators at
the TV input (fixed barrels or variable 'twiddlers').

I would not worry about the balun for TV reception. Just use the 300 to 70 ohm one. I think you will get a lot of loss with the rg 58 coax. Go to the rg6 type coax for much lower loss.

I have a 2 meter horizontal M2 antenna up 70 feet and when the cable goes out I connect it to my converter box. It is fed with about 130 feet of low loss rg 8 type coax and from there I go to about 25 feet of rg-6 type to get to the TV. I get about 30 channels with this setup. Probably 30 to 50 miles from most of the transmitters.

It is possible the TV signals are overshooting you. Sometimes almost under a tower can be worse than being out several more miles. As someone mentioned you may be getting multible and causing dropouts. I had a 2 meter antenna in the house hooked on the back of a transceiver and people walking around the room would sometimes cause a dropout and they were not in a direct line from the rig to the repeater.

He may not want to spam the group but he is more than willing to send spam individually to your email address if he reads it from a posting. He also sent at least seven other identical postings to different newsgroups instead of cross posting. The site he advertises is his. If you get spam, send your complaints to
    abuse@hostmysite.com, groups-abuse@google.com,
and to his posting host abuse@cox.net.
The registrar of his site is Godaddy so you might wish to complain there too. I have already received spam from this jerk before his Usenet postings were sent.

Hey OM:
 A 3:1 mismatch you only lose 25% of the power. And that's power not
voltage. So with 50 to 75 ohms you are not going to lose much. And you
need plenty of signal so there won't be any pixelization. And if you
don't use a balun at all: you have the shield of your coax as an
antenna too. I say connect direct and forget about it.

There's only 2 possibles; either you don't get enough signal or you
do. Those are better odds than the lottery.

73 OM

raypsi <RBorowiak@gmail.com> writes
>Hey OM:
> A 3:1 mismatch you only lose 25% of the power. And that's power not
>voltage.

Where does the 3:1 SWR come from? With the off-the-shelf $2 300:75 ohm
balun, connected to a 50 ohm feeder, the mismatch will be only 1.5:1.

>So with 50 to 75 ohms you are not going to lose much.

Exactly.

>And you
>need plenty of signal so there won't be any pixelization.

>And if you
>don't use a balun at all: you have the shield of your coax as an
>antenna too.

Arrrrrhg!!!!. That's NOT a situation you want to have!

>I say connect direct and forget about it.
>
And I say FIT IT and forget about it! It's so easy to do things
'properly'.

>There's only 2 possibles; either you don't get enough signal or you
>do. Those are better odds than the lottery.
>
You're correct about this bit!

From Tissot, this T-Trend men's watch is rugged and masculine in high performance stainless steel. Handsome satin finished steel case is presented on the emblematic link bracelet in brushed and polished steel. Polished, raised T center links on a satin finished background encircle the bracelet. Fully integrated bezel frames the black dial with silver colored hands, Arabic numeral and baton hour markers. Water resistant.

Complement your most stylish business suits with the modernly styled Tissot TXL men's stainless steel dress watch. This mid-sized watch features a squarish, tank-style watch case (with wide, polished track-like sides) that measures 32mm (1.25 inches) wide. It has a classic black dial face that's accented with silver stick markers, Arabic numerals at the quarter hours, thin silver baton hands (with seconds hand), and a date function at 6 o'clock. The vertical link stainless steel bracelet band is joined by a foldover safety clasp. Other features include a scratch-resistant sapphire crystal and water resistance to 30 meters (99 feet). About Tissot For more than 150 years, Tissot has embodied the innovation and tradition of Swiss watch-making. Based in the Neuchâtel area of the Jura Mountains, in Le Locle, Switzerland, Charles-Félicien Tissot and his son Charles-Emile created the watch making company Tissot in 1853. Whether in the technology of its movements, in the research for special materials or in the very functions of the watch itself, Tissot's engineers and watchmakers have developed pioneering timepieces over the years. A member of the Swatch Group since 1985, Tissot watches are available in over 140 countries around the world.   Tissot uses the best movements (from ETA SA Manufacture Horlogère Suisse), the highest quality materials (316L steel, 18K gold, titanium) and scratchproof glasses (sapphire crystal--at least 2500 Vickers). The company's timepieces have also been chosen as official timekeepers for world championships in cycling, motorcycling, fencing and ice hockey.

This quite unique and very cheap. I like the two level dial artwork. My only complaint is the strap is slack. I suggest installing a nice alligator strap.
I was very pleased when the watch arrived. It was in the original packaging, and it arrived quickly! The watch looks even more fantastic than in the pictures!

Only thing I was disappointed in is that when I opened the original packaging, it completely fell apart in my hands. I would not have cared if the watch were for myself. However, it is a gift, and I didn't expect to be giving someone something where the box fell apart...
I get compliments on this watch all the time even though I have other watches that cost considerably more
Bulova Ladies and Men?s Strap Collection Watch. This Bulova watch features a black leather strap with Willits white enamel dial. Curved crystal with design based on Ward W. Willits House window. Moisture resistant and stainless steel case. This watch is water resistant to 30 meters/100 feet.
Add a uniquely designed conversation piece to your watch collection with this Willits timepiece from Bulova's Frank Lloyd Wright collection. It's based on an

art glass design from the prairie-style Willits home in Highland Park, Illinois, constructed in 1901. This distinctively tall rectangular watch case emulates a stained glass window from the front of the residence, and it features a white enamel dial with art deco flourishes. The stainless steel case offers a polished finish and an off-center crown. It's matched with a smoothly supple black leather strap. This precise quartz timepiece also features a scratch-resistant mineral crystal and water resistance to 30 meters (99 feet). Frank Lloyd Wright (1867-1959) is recognized as one of the greatest architects of the twentieth century. Using innovations in design and engineering made possible by newly developed technology and materials, his work heralded a new thinking in architecture, stressing "organic" structures in harmony with their natural surroundings.

Titanium case and bracelet. Black chronograph dial. Screw-in crown. Sapphire crystal. Integrated shock-absorbing system. 44-hour power reserve. Case diameter 42.5mm. Titanium folding clasp. Automatic movement. Water resistant at 120 meters (440 feet). IWC Ingenieur Chronograph AMG Titanium Mens Watch 3725-03 / 372503 Understated and classic in design, the Ingenieur line of IWC watches continues the 50-year tradition of simplicity of function and high accuracy in timekeeping. Although there used to be an Ingenieur with a stopwatch function, this titanium model is the first to include a chronograph. It features an automatic 79350 calibre chronograph movement, small seconds hand with stop function and a chronograph with a central seconds hand and 30-minute counter. And since the 4 Hz movement is able to display times to an accuracy of one-eighth of a second, the dial includes an outer tachymeter scale for measuring time over distance. The round case and integrated bracelet band are made from solid titanium, which is nearly 50 percent lighter than steel, but 30 percent stronger. It's also particularly resistant to salt water corrosion, as well as hypo-allergenic--perfect for those with metal allergies.   Sublimely designed, this watch integrated the chronograph push buttons into the case and offers a raised bezel with polished highlights and screw-down accents. The black dial offers a patterned center, chrono subdials at the top and bottom, luminous stick markers, small minute indexes, and baton hands (with luminous stripes and seconds hand). Other features include a soft-iron inner case for protection against magnetic fields, anti-reflective sapphire glass crystal, a 31-jewel movement with 28,800 vibrations per hour, 44-hour power reserve, and water resistance to 120 meters (400 feet)--offering protection from accidental splashes as well suitable for swimming, snorkeling, and light recreational diving.   An automatic (or self-winding) watch is fitted with a device (rotor) that automatically winds the spring by using the force of gravity. It needs no battery, but it will stop if you have been physically inactive for an extended period of time--as long as you're moving, the watch will stay powered. Swiss watchmaker Abraham-Louis Perrelet invented the self-winding mechanism in 1770. It worked on the same principle as a modern pedometer, and was designed to wind as the owner walked.   About IWC While founded in Schaffhausen, Switzerland in 1868, the International Watch Company (IWC) was created by an American--Florentine Ariosto Jones. The Jones calibre, the very first movement manufactured by IWC contained a wealth of advanced technical features. These included an elongated index to regulate the balance hairspring and a bimetallic cut balance to compensate for fluctuations in temperature. In 2000, IWC introduced the 5000 calibre, a new automatic mechanical movement with a seven-day power reserve and the legendary winding mechanism of the patented Pellaton system. In the aftermath of World War II, IWC became a company of international scope. Exports to the United States increased and the brand became best known for its specialty watches (now highly prized as collectibles), such as the Mark XI and

Ingenieur--the first automatic IWC with a soft-iron inner case that protected the movement against magnetic fields.

I needed something lightweight to pick up the debris my dogs track in and leave on the hardwood and vinyl flooring downstairs. This is perfect for the purpose. And it's easy to empty. It performs much less well on carpet, but I have a standard vaccum for that. So I'm happy.

This works great on tile floors. The suction has a lot of power and it glides easily, also very lightweight which makes it all faster. Very handy to also be able to quickly pull the bottom rolling part off and have an instant hand vac to fit into crevices and small spaces. The filter cup opens very easily, dumps quick, and the filter itself is easily brushed off. Every other week or so I take the filter off and rinse it with some soap and water and then let it air dry. Its very easy to do as the durable white filter rotates on and off easily.   Sometimes I also add a few drops of my favorite essential oil into the dirt cup after I've emptied it and then when I vacuum my home has the wonderful aroma of the scented oil and it doesn't seem to hurt the plastic or the vacuum in any way! I use 100% pure organic essential oils in it though so I don't know if any other type of artificial or synthetic fragrance oils would work as well.

My last one of these stick vacs quit working after about 10 months of a lot of use, the motor stopped but for the low price that is no problem for me. But my local discount superstore stopped selling this brand and is selling an inferior brand that I already tried and returned. So glad that Amazon is selling these and with free shipping too!

These are really handy for a laundry room, small apartment, an RV, garage and anywhere you need speed vacuuming. Probably not the best for high pile carpet but excellent for low pile carpet, linoleum and tile and can also be used as your car vacuum!

I usually don't write reviews, but I had to for this one!! Because it's so not fair not to write anything about such a wonderful product. I use it for my wood floors and also carpets, works like a charm!! Works better than all those expensive vaccums

Does very well. Have a question. Is it alright to connect this to an extension cord? Cord that is with vac. soooooo short.

This works very well on our tile floors. I imagine that it would work just as well on any hard surface. It's not as easy to move on our carpet, but the hand-held vac on a stick is still great on carpets!

Bissell Featherweight Lightweight Vacuum

A remarkably lightweight cleaning unit, the Featherweight stick vacuum from Bissell offers dual functionality in one slim little machine. Suitable for bare floors, draperies, upholstery, and low-pile carpets, the Featherweight converts easily from a floor vacuum to a hand vacuum and includes a crevice tool for tight corners. Completely bagless, the unit collects debris in a dust cup with a washable cloth filter. When the cup fills up, you just pop it off and empty it. Handy for small areas or anyone who needs a lightweight cleaning tool, the Featherweight stands 44-1/2 inches high and has a 9-1/4-inch nozzle. It comes with an ergonomically designed grip, and Bissell includes a limited one-year warranty.

The Hoover S1156 Sidewinder hand vac is easy to handle, has great suction, and not overly noisy (unlike the Dirt Devil it replaced which was noisy and did a poor job of getting up dirt.) Used in my automobile. Cleaned seats beautifully and was strong enough to get grit, sand and small stones off the floor.
I have a great dog that sheds and this vac is fantastic picking up all fur off wood floors and carpeting. Thank the Fur Gods! at Hoover
I love this hand vac. I have used many different ones over the years but this is by far the best. I have two dogs and it works wonders on getting up the dog hair. It makes cleaning easier. I have not found any problems with it at all. You can't go wrong with this purchase.
I purchased the Hoover Sidewinder a little over a month ago and it never ceases to

impress me. I had originally bought it to take care of the cat hair on my dark blue furniture (which made it look like I had NO cats afterward) but then I used it to vacuum my area rugs, once again they look like new. Finally a few days ago I decided to use it to Vacuum my car and could not believe how great it did! The swiveling head makes getting into nooks and crannies a breeze, it has a long cord so you don't have to move to a different outlet every few feet and the rotating brush picks up the toughest of pet hair. No disappointments here and the price was very reasonable.

I liked this vac, as soon as we fired it up... great suction, and the beater brushes worked great picking the crud up off the carpet, or the furniture. However, much like the Dirt Devil hand vacs, they have a very poor design using a belt-driven beater brush, which is very prone to problems when hair gets around it, and when the belt warms up. The belt stretches out, and that with any hair on the brush, creates too much friction, preventing the brush from spinning. Someone needs to design something a little better to keep the brushes spinning. Or a better belt drive... something with a little strength to it... and not so prone to stretching. I ended up 'fattening up' the drive post that the belt goes around, with a little duct tape, which seems to have taken up the slip that the stretching caused. This got the vac back working like new... and it really did a great job cleaning. I do like the removeable / reusable bag much better than the Dirt Devil's cheap paper bag inserts.

A Versatile Hand Vac for Home & Shop - Exclusive 90" Swivel Nozzle - Powered Brush Roll - Bagless Design - E-Z Empty Dirt Cup - Washable Filter - 20' Power Cord

Sturdy as a belt sander, the Sidewinder Hand Vac is an all-purpose household tool with a cleverly helpful feature--a nozzle that swivels 90 degrees to provide more flexibility in vacuuming hard-to-reach spots. This is helpful in vacuuming out tricky spaces, such as between moldings and doorjambs, or the concavities of recessed windows. The Sidewinder also has a powered brush roll, especially useful on rugs or fabrics.   The Sidewinder has a 20-foot power cord, a workable length for most any household room. The body of the hand vacuum is made of sturdy glitter-gold plastic, and the transparent collector receptacle end is a darker, smoky-gray in color. Its removable filter is made of a long-life, washable plastic weave. The ergonomically molded handle is designed so that the on/off button is in a comfortable position to be used with one hand. Cleaning the Sidewinder Hand Vac is very easy. The collector cup detaches for easy emptying, and the filter is removable and can be washed in warm, soapy water. (The filter should be entirely dry before being replaced in the vacuum cleaner.) The motor/handle section is not immersible, and it is not advisable to put any of the components in the dishwasher. The Sidewinder measures 13 by 6 by 8-1/4 inches. Hoover products include a one-year warranty against defects and come with a detailed instruction booklet. --Garland Withers

A 3:1 swr does not really equate to a 25% power loss. I think it was the ARRL that published a chart that at first glance may make it look like that.

In a lossless missmatched feeder, part of power is reflected back at each end, while a portion is delivered to the antenna and radiated into space and finally after many reflections most of the power is finally radiated into space.

The localized voltage and current peaks can be an issue both in the feeder or transmitter.

However, with a lossy feeder, some power is attenuated i.e. converted to heat on the initial path to the antenna, also when part of the power is reflected from the mismatch at the antenna, the reflected wave will suffer from the attenuation and again after reflecting from the other end, it will again suffer some attenuation. After several reflections, quite a lot of the initially reflected power is converted to heat.

When looking at the ARRL charts, to get a 25 % or -1.25 dB power loss, the feeder loss when matched would be 0.8 dB and the additional loss due to the 3:1 SWR would be about 0.4 dB.

But where has this mythical "3:1" SWR come from? I can't see what it has
to do with connecting a 300 ohm antenna (in the attic, and with or
without a matching transformer / balun) to a long run of 50 ohm coax
which eventually connects to a 75 ohm TV set (in the basement). I've
obviously missed something. Please would somebody explain!

Yes, this type of thing works, and might be OK for wrenches or pliers that never get used near electronic equipment. But do not use these for tools that might ever come near a computer, even if you own a degausser. And whatever you do, DO NOT hold edge-tools (like chisels or saws) with a bare metal magnet as shown in the photo.
Magnetic tool holder holds metal tools, keeping them in sight and on hand. No more rummaging through a crowded drawer. Keeps your chisel edges sharp and nick-free. Great for wrenches, chisels, screwdrivers, turning tools and more. 2" Wide X 18" Long.

Okay, there are two groups of folks looking at this item, Steampunk costume folks and welders.

For the welders:
- Well built, inexpensive
- Both the clear and shaded glass were flat and well-attached
- The ventilation on the goggles was especially good

For the steampunk folks:
- The googles themselves are rubber-plastic, would need decoration
- Strap is decidedly modern looking
- There is (safety) text on the lenses
- Look pretty good and are cheap

*The ultimate rotary tool and accessory kit - an exceptional value!*Variable speed to 30,000 RPM, powerful 1 Amp long-life motor*INCLUDES 30" flex-shaft pencil grinder and stand - expensive extras with other kits*100-piece accessory kit comes in custom-fit wooden case - keeps bits easy to find*Multiple tools in one; grinder, sander, polisher, drill, rotary saw, cut-off - incredibly versatile!We consider this to be one of the most useful--and most used--tools in our workshop because it does so many different things well. We've used it to sharpen lawnmower and chainsaw blades, buff away rust, cut bolts and screws, sand hard-to-reach corners and make intricate wood cuts. The key to its varied functionality is a powerful 1-amp motor with variable speed up to 30,000 RPM. Includes wide variety of quick-change collets that let you swap functions instantly. For really tight spots the 30" flex-shaft pencil grinder attaches easily to the tool--which then hangs on the included adjustable-height stand. The rotary tool comes with 40 accessories but in this special offer we're including a fantastic 100-piece accessory kit in custom-fit wooden storage and carry case to keep your bits organized and easy to find.

Works well ,but not as powerful as claimed, I have an old cheapie from harbor freight with 250 lbs of torque, this porter cable is no more powerful than it is. No power, no torque, you get what you pay for
I'm not brand loyal, I look for the best tool at the best price. I searched the local stores and this tool offered 400 ft/lbs for 79.95. Works great for home/garage use and looks great too.The 20 pc socket set can't be beat for the price either.
Get plenty of control, not to mention power, with the Porter-Cable PT501 1/2-Inch Pneumatic Impact Wrench. This variable-speed impact wrench allows for precise control during use, and its durable pin clutch mechanism ensures years of trouble-free operation. The PT501 displays exceptional power and speed reaching 7,000 RPM, 1,000 BPM, and an incredible 400 ft./lbs. of torque. This compact, 1/2-inch impact wrench manages 4.2 SCFM at 90 PSI, so it's compatible with most air compressors.

Hi Herb,

That number is "house number." Those numbers hide the commercial equivalent of that transistor. I doubt you will find any Motorola documentation giving you an equivalent. There may be some cross reference guide somewhere that some gracious soul assembled but I bet it will be without Motorolas blessing !
There is a very high probability that you can substitute any of hundreds of similar transistors and they will work, depending on the function of that transistor. If it was used for RF amplifier service you could try a 2N3866 or 2N5109, for example.

I used to work for Western Electric and the Bell System did something similar. We had "KS" parts. In most cases they were identical to commercial parts but we did quality sampling, life cycle testing, etc. on them and assured ourselves that we weren't getting scrap swept up off the floor. For this we marked up the price about ten fold (!!!) as we supplied these "approved" parts to our factories. The factories built things then that they expected to last 50 years. Motorola probably did the same. This also helped to keep repair technicians from substituting "commercial junk" into Motorola equipment and destroying their pristine reputation. But I digress......

Hmm, I don't know if it is a house number. My 1987 D.A.T.A. Transistor
book goes up to only SS3638.

How was the transistor used, as much information you can give would be
helpful, frequency voltages power anything you can think of.

Web sites that do part # to Federal stock # can be a big help in
researching parts as they often include house numers and obsolete
parts. Once you find  FSN or NSN search for it by FSN and you may find
replacement parts. I recently located a replacement this way. I would
also try replacing the SS with 2n,2sc....ect and see what comes up.
Check the specs of the transistors it list against the requirements of
the circuit.

Good hunting.

Jimmie

Hi,
the transistor is unused sitting in my junkbox and is waiting for
something to do. hi
I have got more of them. If i can't find any infos, then i will try to
build,for example, a Norton ampl. and compare it with one of my
favorites like 2N5109 But voltages and power are vitally to know.

1/4 wave filters used in repeater duplexers have quite high unloaded-Q and are available to at least down to 50 MHz. Of course these are long, but in order to reduce total shape, these might be bent into U-shape.

To go into even lower frequencies, the resonator can be bent into a helix. At least the design nomogram in old ARRL handbooks seem to indicate that with sufficient size very high unloaded-Q could be achieved (up to several thousands). Of course the helix itself and the inside of the resonator may have to be silver plated.

IDEA

Many things are much simpler to make if switching RF components is avoided.

Historically, the most common connection type used for interchangeable coils seems to have been the octal socket and plug. The practical cons of this and similar solution are availability, lead length, and 1:1 tank-circuit to plug ratio.

OBSERVATION

When I look at the long gold-plated multi-contact plug-in connections on a PCI bus et similia, I see several advantages:

- many connections to play with, often used for large bandwidth signals

- connections spread along one dimension, hence plugging more than one RF-separate group of components on one card in one gesture seems conceivable

- one board extends at 90deg from the other, adding useful real estate within a small radius (cautions apply...)

- the plug-in board can itself hold structures with a vertical component, such as small shielding enclosures

- multiple contacts can be used for grounding, effectively helping keeping multiple component groups well separated, and also for other low impedance connections

- last, but not trivial, a card could have some free flat space opposite the contact edge for grabbing and pushing without touching and stressing the components themselves.

COMMENTS

In practice, I want to resuscitate a rough avatar of the HRO "tuning drawers" of the 1930's.

As an example, I am designing a bi-directional triple-tuned circuit around a triple variable capacitor, for use as a full coverage preselector/output filter - potentially from LF to HF.

It would be nice to put three combinations of coils and capacitive trimmers on a single card and stick it in to change bands. If that were possible, it would be trivial to design some cards for broad tuned coverage, others for a narrower band or even non-tuneable for a single frequency - not using the variable capacitor.

As a matter of course, different LPF's could be swapped in the same way.

This would be less convenient than switching, but would also obviate the need of wafer switches, switching diodes, reed relays &c. &c. and potentially introduce scope-oriented, not just frequency-oriented modular flexibility.

If I could find blank two-face copper clad PCI cards in a few different sizes I'd surely know how to put them to good use!

QUESTIONS:

- I don't recall seeing examples of this, including components or groups of components that are
.   * multiple
.   * functionally separate
.   * RF-segregated
.   * RF-hot at the same time
.   * at successive stages on a signal path
.   * on a single plug-in card.

Other than the HRO drawers, are there any?

- Any suggestions for card and socket formats that are
.   * standardized
.   * widely available
.   * perf board or single / double copper clad
.   * blank or with minimal preset paths / swathes
.   * ...or just the gilt contact edge, on which a board could be bolted/glued?

I hope I have indeed missed the classic elephant in the courtyard, and that a solution is at hand at www dot whatanewbie dot com.... ;-)

Thanks in eager anticipation!

Filippo N1JPR / I2

```

I'm making a quick and dirty frequency "octupler" (x8) that uses a string of three Mini-Circuits frequency doublers (AMK-2-13+, KC2-11+, KC2-19+) -- 300-312.5MHz in, 2400-2500MHz output (the ISM band). I believe these are just diode ring-based mixers hooked up and optimized to act as doublers; they have an insertion loss of around 11dB. I have buffer amplifiers at the output of each to make up for this loss, but I'm wondering... do I need to bother with bandpass filters as well? Without them each doubler suppresses the fundamental and 3rd harmonic by some 40-60dB (depends on input frequency); the 4th harmonic is suppressed by ~15dB. Is anything undesireable going to happen if I just let everything through? That would mean that at the final (x8) output, I'd still have plenty of lower frequencies around -- albeit pretty well suppressed -- as well as some x12, x16, etc... but the x8 component should still be the strongest by far.

For a diode ring-based mixer, it's not entirely clear to me whether or not having some low-level "junk" to the RF input is all that bad. As a man once said to me, "diode mixer RF ports like being driven by squares waves," so the higher harmonics don't seem as though they'd matter much... but will the lower-frequency signals tending to dither the exact turn-on point of the diodes be deleterious?

---Joel

I dont think SS was a house number. I remember using some of the SS
transistors in my military days. If I am correct they were made in the
60s and are just long time obsolete.. The ones I remember were used in
a servo amp for a mag tape drive and were bad about going out. When
the drive would fail we almost immediately would change the SS
transistors as a first course of troubleshooting since they were very
easy to change(socketed) and usually the problem.

Here is a list of transistor prefixes SS was used on Motorola silicon
transistors:

Here is a list of semiconductor prefixes.

Pro electron A... (germanium)
Prefixes in the Datenblattsammlung:AA... AC... AD... AE... AF... AS...
OUTER ONE... AY...
of the manufacturers: AEG Telefunken, SIEMENS, Sescosem>sgs thomson,
VALVO>PHILIPS

Pro electron B... (silicon)
Prefixes in the data sheet collection:
BA.. BB.. BC.. BD.. BF. BG.. SHEET. BP. BREAK. BS.. BT.. LE. BX.. BY..
BZ..
of the manufacturers:
AEG Telefunken, INTERCMetal, MOTOROLA, RCA, SIEMENS, Sescosem>sgs
thomson, Texas Instruments, VALVO>PHILIPS
some also of BENTRON, FAIRCHILD, FERRANTI, GENERAL INSTRUMENT,
NATIONAL SEMICONDUCTOR, SAMSUNG, SILICONIX, SPRAGUE
and for opto-electronic parts (BP...) also of SILICONE GENERAL and
BENTRON

and for thyristors, triacs uww.(BT...) also of TRANSITRON

Pro electron C... (gallium arsenide)
Prefixes of the data sheet collection:
APPROX.... CF... CN... CQ... CX...
of the manufacturers: AEG Telefunken, SIEMENS, VALVO

JEDEC Registration

1N.... (diodes)
In the data sheet collection of:
FAIRCHILD, GENERAL ELECTRIC>RCA, GENERAL INSTRUMENT, MOTOROLA, RCA, Sescosem>sgs thomson, SEMTECH, SOLITRON, Texas Instruments, UNITRODE some also of CODI, GENERAL SEMICONDUCTOR, HEWLETT-PACKARD, M/ACOM, MICROSEMICONDUCTOR CORP., SEMICON, SIEMENS, SILEC, TELEDYNE, TRANSITRON, UNIZON, VALVO

2N.... (transistors)
All American manufacturers, also many European and Japanese. Before 30 years it belonged to the good clay/tone to have at least some JEDEC types in the program. In the reason it unimportant also, from which manufacturer the data sheet comes, because the uniformity was more strictly supervised, as at most other families.

3N.... (FETs, opto coupler)
In the data sheet collection of:
GENERAL ELECTRIC>RCA, INTERSIL, MOTOROLA, RCA, SOLITRON, sprague, TELEDYNE, Texas Instruments

4N.... (opto couplers)
In the data sheet collection of:
HEWLETT-PACKARD, MII=3DMICROPAC INDUSTRIES Inc., SIEMENS, Texas Instruments, ENGINE

&Ntilde;.... (opto couplers)
In the data sheet collection of:
HEWLETT-PACKARD, MII=3DMICROPAC INDUSTRIES Inc..

Japanese type rows

1S.... (diodes)
In the data sheet collection of:
MATSUSHITA, MITSUBISHI, NEC, NJRC, ROHM, SANYO, SONY, TOSHIBA

2SA.... (PNP)
2SB.... (PNP, power)
2SC.... (NPN and NPN HF power)
2SD.... (NPN, power)
In the data sheet collection of: FUJITSU, HITACHI, MATSUSHITA, MITSUBISHI, NEC, ROHM, SAMSUNG, SANK, SANYO, SONY, TOSHIBA

2SJ.... (P channel FET)
In the data sheet collection of HITACHI, NEC, SONY, TOSHIBA

2SK.... (N channel FET)
In the data sheet collection of HITACHI, MATSUSHITA, MITSUBISHI, NEC, ROHM, SONY, TOSHIBA

3SK.... (N channel DGMOSFET)
In the data sheet collection of NEC and SONY

Joel Koltner wrote:
> I'm making a quick and dirty frequency "octupler" (x8) that uses a string of three Mini-Circuits frequency doublers (AMK-2-13+, KC2-11+, KC2-19+) -- 300-312.5MHz in, 2400-2500MHz output (the ISM band). I believe these are just diode ring-based mixers hooked up and optimized to act as doublers; they have an insertion loss of around 11dB. I have buffer amplifiers at the output of each to make up for this loss, but I'm wondering... do I need to bother with bandpass filters as well? Without them each doubler suppresses the fundamental and 3rd harmonic by some 40-60dB (depends on input frequency); the 4th harmonic is suppressed by ~15dB. Is anything undesireable going to happen if I just let everything through? That would mean that at the final (x8) output, I'd still have plenty of lower frequencies around -- albeit pretty well suppressed -- as well as some x12, x16, etc... but the x8 component should still be the strongest by far.
>
> For a diode ring-based mixer, it's not entirely clear to me whether or not having some low-level "junk" to the RF input is all that bad. As a man once said to me, "diode mixer RF ports like being driven by squares waves," so the higher harmonics don't seem as though they'd matter much... but will the lower-frequency signals tending to dither the exact turn-on point of the diodes be deleterious?
>

Yes, anything below the desired 8x frequency and anything above that isn't a harmonic of it will cause spurious mixing products when your intent is to drive the LO port of a DBM with it. What happens within your octupler doesn't matter much as long as you filter the final output.

BTW, in the olden days we preferred 3x, 5x per stage. Two 3x stages would give you 9x. The most brazen ones (not me) did a direct 7x or even 9x. We just drove transistors in class C real hard.

Wonder if an adjustable coil loopstick and variable capacitor preselector between the antenna and the crystal set would improve reception for distant stations on the broadcast and high frequency bands? David

Nope, you have the same problem with loaded vs. unloaded Q and efficiency.

You can get there from here, you just can't do it with that loopstick.

OK, I was curious. Was I way off-base, or is it reasonable to think that you can get a 10MHz Qu considerably higher than 250 (and possibly up in the stratosphere above 1000)? I'm not going to spend the time, effort and money to build a seriously large coil as the theory suggests I'd need, but I did wind a somewhat smaller one...

I wound 15 turns of #10 AWG (2.55mm) bare copper with about 2.25 inches ID and 3 inches long. I resonated it with 3 * 12pF C0G capacitors; it resonates at 9.088MHz. I coupled an output to an analyzer through 1pF tapped one turn up from the "cold" end, and loosely coupled an input from the analyzer's source using a one-turn loop spaced away from the coil. My back-of-the-envelope calculation says such a coil with air insulation should have a Qu around 740 at 9MHz. In a tank circuit, the finite Q of the capacitors will lower the tank Q below that value. What I actually measure is a 3dB bandwidth of 15.87kHz, for a tank Q of 572. OK, so that's a bit lower than I might have expected. BUT--this coil is wound on a length of black ABS drain pipe, which is an absolutely terrible thing to use as a coil form if you're trying to get the highest possible Q. (My plan was originally to take the coil off the form after I wound it, but it had too much of a mind of its own about what shape it was going to assume. I've wound some smaller self-supporting coils, but this one didn't work that way.)

I'm convinced by this little 'speriment that I could build an LC tank resonant at 10MHz with a tank Q above 1000 with no trouble--and probably _well_ above 1000 if I used really high Q capacitors and just enough low-loss solid insulation to keep the coil turns properly spaced. I don't need one at the moment, but if I ever do, I sure won't be afraid to try it.

Cheers,
Tom

   And the claim that a TRF receiver was simpler to use than a
super�heterodyne.  It makes you wonder if the author even knows how a
TRF receiver works.  Most had a separate knob per tuned circuit, since
the attempts at gear driven tuners didn't track very well.

Or today, many of us just overdrive an untuned MMIC amplifier and filter
out the unwanted harmonics...

Ok, I admit to lowballing my practical estimates. I don't want to be argumentative about it but it the steps of increase become incrementally more difficult to obtain as you approach higher levels of Q. Never any harm in trying to make the best possible coil for the application.

Good luck with your projects!

-Bill

I think Ten-Tec has a HF transceiver with plug-in modules, I don't
know exactly what's in each module.

The Norcal Sierra is a pretty spiffy implementation of I think exactly

what you are talking about. URL for a handbook article with really
nice pictures:

If a huge drab-green truck stops in front of the house and folks in fatigues and army boots hop off then the unfound oscillation has been found ;-)

Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/moderated/crossposting
Revision: 1.1 2009/04/12 19:42:04
Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

Listening to all the "crap" on the bands these days, I doubt ANY truck
from the government would ever show up ;) However, that being said, as
hams, we all need to make sure our "house is clean"...now about all that
other "crap"...has anyone else noticed all the interference these days

```
on 2M from other sources of "spurious junk"???  Examples:  I pull up to
gas pumps and the squelch opens on my 2M radio...driving down the
Interstate, I pass semi trucks and get a static burst from the
speaker...Drive through town, listening to 145.19 and get static bursts
(this just happens to be a cable TV frequency...isn't the idea of cable
TV to keep the signals INSIDE the cable?)....

Scott

Sure, but when you see how cable "professionals" handle stuff you'd get
the goose bumps. We don't have a cable subscription but a cable box down
the street. Often I see workers in the street and when walking the dogs
next day the lid on the green box is askew. Heck, often they didn't even
slide the lid all the way in, let alone lock it. Being a guy who can't
stand the sight of electronics just rotting and corroding away because
of neglect I always push it back on. Once the lid was completely off, it
rained and water was dripping from all the coaxes. This doesn't exactly
improve shielding effectiveness ;-)

The FCC *does* sometimes pursue interference and leakage complaints
against cable companies. It may take a while to get them moving, but
there are NOVs (Notice of Violation)s filed by the FCC against some
cable companies with more leakage than allowed.

A fair number of cable techs are hams, too, though not all. Calling the cableco office and reporting interference, with a followup paper letter, generally will get someone's attention.

Around here (Central Oklahoma, EM15gf in particular), it's the LED traffic signals and the casino signs that put out hash. The traffic signals are bad up around 2 meters, and there's one casino sign that was taking everything from 40 (or 80) meters up through 2 meters.

HB content: I'm thinking of building one of the little receivers shown at <http://mikea.ath.cx/1-chip-rx.html/>, just for hunting QRM. Note: the second image has some editing performed on it to make some things a little clearer; the first one is as it came off EDN.

I like his sentence, "you can do only so much work on a notebook computer with no reference material around." Wow -- 1997, before ubiquitous high-speed Internet access (...reference material on pretty much anything you want in seconds...) in airports was available! And it doesn't even seem that long ago now!

I suspect taking a radio like that to an airport these days is also going to get you a lot of close scrutiny going through security... so I like your idea of using it for QRM hunting.

I don't agree with Steve there. In the early 90's I regularly carried my trusty old Compaq Contura 410 on longhaul flights. And I sure was glad it allowed up to 6 hours on a battery charge. Did a lot of schematics, module specs and so on. Seen many business execs with their high faluting IBM laptops fold'em because their batteries were at zilch, grumpily watching me plugging along until 2nd mealtime.

The trick was to place asterisks in the document whenever I could not complete something because I didn't have the datasheet right there. At the destination I'd then go from one asterisk to the next and complete the module spec. Same for new non-lib CAD parts where I didn't have the pinout, I just placed an asterisk in the schematic. One can get a whole lot of work done at an airport or during a flight.

Nowadays you can carry tens of thousands of PDF datasheets on the hard drive of your laptop. Easily the equivalent of a large book shelf full of databooks.

I was lazy and just bought a Realistic Jetstream pocket radio. $30 or $40, looks like a normal pocket radio but has regular AM plus airband, no FM.

Thank you Tim, problem solved. As you said the Sierra multiband CW transceiver proves the viability of edgecards for plug-in band-specific subassemblies, the article even points out how simpler the

plug-in implementation is, compared to the switching solutions for the
same problem, citing Wayne Burdick, N6KR's older Safari-4.

After a bit of checking, the current sockets are these:
- Manufacturer: www.sullinscorp.com p.n. EBM25DRXH
- Digi-Key: p.n. S3355-ND

PBT/Phosphor Bronze, Contact Surface: .000010=94 Gold
Termination: .000100=94 Pure Tin, Matte
.156=94 [3.96mm] Contact Centers
50 total contacts, Dual Readout
.200=94 [5.08mm] Row Spacing; .137=94[3.48] Long Dip Solder, straight
Mounting With .125" Hole

Pretty sure I can find similar edgecards & sockets around here.

Thanks again.

Filippo

Greetings; I just happened upon this discussion while searching for more crystal set information. I've tinkered with "free power" sets back in the seventies, and am currently an experimenter/collector with/of vintage radio. It is possible to build voltage triplers and quadruplers for crystal radio, but it isn't practical. No one does it since it doesn't work very well. Pretty crappy.too much loss in diodes Waste of time. BUT, certain full wave set-ups DO work and work quite well. There has been much engineering and engineer-speak concerning crystal radio. Much SPICE work, much analysis's, many mathematical equations. But there appears to be a paradigm going on that makes it verboten to consider the lost cycle. Standard crystal sets (and those that use several detector diodes in parallel like the schottky 2380) are half wave rectifiers. What about the other half of the Electromagnetic wave? Half the potential power of the radio wave is gone, wasted. It can be recovered and utilized. But it must be done correctly. At any given cycle the current must flow through one diode, and only one (I'm considering multiple diodes in parallel as one here). So bridge rectifiers are out. Triplers and quads are out. You can use a coil with a center tap, essentially two half-wave rectifiers, each one detecting half the signal. Another way that works is making a half-wave voltage doubler. Imagine a standard crystal diode set-up; tank coil on the left, diode at the top with cathode line to the right facing the 'phones, and the anode end facing left towards the coil. Now add a fairly large capacitor, mica or low-loss metal film or poly inserted between the diode's anode and the coil. The system still works as a standard crystal set; except for a little capacitive reactance, the signal passes along as usual. Now picture a second diode with it's cathode end connected to the connection between the capacitor and the first diodes anode. Again, this setup works like a standard crystal radio, when the cycle is positive. But now, when the cycle turns negative, instead of the negative cycle being blocked by the first diode and being wasted, the negative cycle is "shorted" out by the second diode, and goes to ground. Shunted to ground, but not wasted. The capacitor now has a charge on it equal to the RMS value of the wave times the square root of 2, or 1.414. It's been charged. Electrons are piled up on the right hand side of the capacitor, towards the anode end of the first diode. Now when the signal swings positive again, the electrons of the signal pass around through the negative/ground side, through the 'phones, through the cathode end of the first diode, and out the anode of the first diode, where they encounter the capacitor. It doesn't exactly work like this, but this is a good way to get the picture. Anyway, the electrons going out the anode end encounter the capacitor where electrons are piled up/stored on the capacitor's plate facing the anode end of the diode. The two charges combine, nearly doubling the power.

Try at least a 1000 (.001 uf) picofarad capacitor. Some folk use 5000 or a .01uf. You should still use a filter cap across the 'phones, like about 500p.

I've seen where people have built such a circuit, and claim it's no good. One such circuit only had a 30p capacitor. Of course it didn't work! There's nothing new about this type of voltage doubler that makes use of the other half of the wave. There's nothing new about a full-wave rectifier using two diodes (one for each wave cycle) and a center-tapped coil. it's been published back in the early 20th century. With a good antenna you can drive a high-impedance speaker!

Hi tack. I've seen you on some of the other forums.

No disagreement in that you can recover the other half and add things together. I offered the full-wave centre-tapped coil as an example.

But that only works for humble 'local station' circuitry.

How can we do the same thing for low-level/high selectivity circuits? I dunno. The predominant thinking is that you get the voltage 'gain' by going to the moon with hi-q rf circuitry which is at odds with a bunch of diodes configured as a multiplier because of the loading factor. Or having some other mass of wire on the same coil form. Kills the Q and consequently kills off the voltage gain.

Now if a guy has enough room...I'm only being partly facetious...to have tuned circuit A separated far enough away from tuned circuit B (or C or D) he could probably find a way to combine them. A good hi-q circuit might require 12 inches plus of physical isolation. I've not seen anybody approach it that way . Probably because the expense and effort of multiple tanks is mitigated by less effort on a good single tank.

Crystal sets remain to be a fascinating 'open book' for experimentation.

-Bill

Some of them might have considered the shorter battery life a *feature*, you know. "Well, I did what I could on the annual report until the battery died, at which point I decided to see how good the stewardesses were at making martinis!"

Ok, strictly DOS on business trips. There was no need for more, and
besides PDF viewing and stuff there still isn't. OrCad-SDT, MS-Word 5.0,
CompuServe email client, PSpice, some filter simulators, beam profile
calculator. What more could mankind want?

Oh, I had my brewskys, cognac and the occasional bloody mary while using
the laptop. Of course, nowadays it's easier since I have that
spill-proof Durabook laptop that is almost mil-spec. The old Compaq
began to physically disintegrate after roughly 1/2 million miles,
courtesy of a few really rough flights and landings. At the end the
battery kept falling out of it.

Wondering if any of you who use Dimesion 4 software to keep the PC clock
accurate, have you noticed that it appears the site (tick.usno.navy.mil)
that is used for time updates is down??? My last correction was on 29
April 2009. Keeps timing out. Anyone else see this?

Scott

Summary: Recruitment announcement for ham-radio-related FAQ articles
Keywords: FAQ, Intro, amateur, ham, radio, recruit, recruitment
X-Original-Bytes: 2709
Xref: g2news2.google.com rec.radio.amateur.antenna:11672 rec.radio.amateur.dx:389 rec.radio.amateur.equipment:1523 rec.radio.amateur.homebrew:2673 rec.radio.amateur.misc:4244 rec.radio.amateur.policy:26141 rec.radio.info:724

Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/recruitment
Revision: 1.1 2007/09/29 18:42:47
Posting-Frequency: posted monthly
URL: http://www.faqs.org/faqs/radio/personal-intro/

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to rec-radio-info-request@panix.com.

Hmmm...mine used to work. In fact, it was working fine up until April
29th...I selected a different site (St. Paul, MN) last night and it is
updating normally...

I just changed my config to point to that server and it's working OK for me.

I usually use my ISP's own time server.

Hi Bert,
Thanks...I suspect it's something with my ISP. I have lots of these
things happening...someone sends me a link to a webpage and I copy/paste
the address and it says it can't find the site yet it seems everyone
else can. I changed to the nss.nts.umn.edu site and it's working fine.

Hi Fred,
Actually, I did that with the same results.  Several others didn't seem
to work, but I found one in St. Paul, MN that works fine.  Others have
reported that "tick" is working fine for them.  I suspect something with
my ISP as I have had quite a few problems viewing websites that others
send me a link to and I get the "site could not be found" error message.
  I've called my ISP and they say that everything is working OK.  Some
have suggested my firewall may be blocking sites, etc., but the tick
site had been working fine up until April 29th when I got the last
update and I haven't dinked around with any router settings here for
ages...mystifying :(

Hey OM:

I likes to use tcpdump, or the GUI version Wireshark. These baby's are great sniffers I found a java problem I had once, because of a setting in a router, I had no control over. Seems someone got the great idea to block ICMP protocol going thru the router. It was this very protocol that java used to acknowledge the extension of the MTU from the max allowable 1500 to a larger MTU. My computer would sit there waiting forever for that acknowledgment it was never going to get. Later I found out why ICMP was blocked. As the router had been taken down by a denial of service request attack via ICMP. Lowering the MTU on my computer to allow for java to extend the lower MTU without having to do a ICMP request, fixed the trouble. I ended up using 1300 MTU.

Then there's whois, it's possible you have the IP addy stored away in the program and it doesn't use a DNS to look up the IP addy and the mil site may have changed the IP addy in which case your program won't find the site it was looking for. Your browser will find it if it's using a DNS to look up the site. But if the settings are right/wrong it is possible for the browser to use a cached IP addy that would be stale, and so you don't go to where you wanted to go.

Hi

Hope I can get some advice from the experts about my antenna.

I have a 50ft self supporting tower, my goal is to put 2 antennas up. One dipole and one omni.

I have an old omni direction antenna that I wish to put at the top, it has 3 traps in it with no writting on it so I am not sure what bands it will be suitable for however I have a pretty good tuner so I can use it on most bands. I also have one of those brackets that allows me to use ground planes with it, 4 ground planes aluminum and longest possible is what I try because the wind brings them down fast.

Second is a simple dipole, I think it is 60 foot each side or little more however it hangs over the trees on each side so it isn't perfectly straight. It is connected to a ladder line then connected to my tuner then my Drake TR7.

These two seem to work OK for me in the past, I hope for some advice on these and please answer the following questions.

1- Any idea what the omni direction antenna with the three traps is for which bands? It is about 22ft long with the three traps on the bottom half, old aluminum antenna.

2- What about those ground planes? Are they necessary?

3- On the dipole, I have a 1:1 balun in the garage, should I use this with the dipole? The antenna tuner already has some device to balance so is it necessary for the other balun? Someone told me it is so I must ask.

any advice would be great,,, thanks

Neal

Can you borrow an MFJ 259 or equivalent gadget? It will tell you where
the antenna is resonant. I use mine a *lot* for things like this.

Basically a fullwave rectifier?

I'd still opt for a quality matching transformer, and go for the max.
volume if that is the goal.

Pete

Are there some vendors of readily available (stock) inductors that have reasonably good Q's (>100) throughout the HF band?

I'm familiar with something like the Coilcraft "maxi springs" (http://coilcraft.com/maxi.cfm), and while they hit Q's of 100 by 30MHz, I'd really like something that's already there by 3MHz or less (...and still have a self-resonant frequency of >30MHz). This seems quite doable simply by making a larger coil with thicker wire, I'd just like to find a place that offers such inductors off-the-shelf rather than having to wind my own. Inductance in the ballpark of 1-10uH would be good, although it's not critical.

The goal here is to try out making some adjustable notch filters for a receiver (by switching L's and C's in and out, like antenna tuners do). Hence, high Q is important, but power handling capability isn't so much, and anything smaller than a breadbox is fine size-wise.

Thanks,
---Joel

Yabbut...max volume isn't the same as max sensitivity in DX sets. Its
only one part of the scheme. I used the term "house of mirrors" in all
seriousness. You upgrade the xfmr to a certain point then you need a
diode that performs to that level and then you need to upgrade the tank

to that level...and so it goes. Thats why high performance crystal radios are so fascinating. And they really are. I've logged Brasilians at 3500 miles away.

The guys who are top-scoring in the annual 'test' are logging 100-200 stations. You get there with selectivity and sensitivity...and patience with good ears. No doubling, tripling, quadrupling circuits are in the mix. They don't pan out. Its all well documented.

-Bill

You'll be limited by physics, Joel...I know you know that, but I think it's worth putting bounds on things. If you're willing to use a coil on a powdered iron core, you should be able to get the sort of Qu you're asking for in a fairly compact coil. If you want to order production quantities, you can easily find vendors willing to wind specific coils for you, but if you want just one or a few, you may have more difficulty. I've had situations where I wanted to avoid the distortion of a powdered iron core, and used some "air core" coils (actually phenolic, I think) from API Delevan and equivalent ones from Gowanda. They were "stock" values, but I learned that they commonly build them when they get an order, but try to have a few around they can ship as samples. But again, they aren't as high Q as you want at the lower HF frequencies.

For an air-core coil at HF, you can estimate the size required for a given Qu pretty accurately as Qu =3D 100 * D(inches) * sqrt(f(MHz)). That's about right for a coil the same length as its diameter. There's a chart in the Sams/ITT Reference Data for Engineers book that gives essentially a correction for the length, if it's shorter or longer than that. At lower frequencies (AM broadcast band, and up to a very few MHz) you can do a bit better with the appropriate Litz wire. Anyway, for example at 4MHz, expect to need an air-core coil about 1/2 inch diameter to get Qu around 100.

It used to be that you could buy a supply of AirDux or equivalent coil stock, and just cut off the number of turns you needed for some specific inductance. My answer to that these days is to thread some plastic tube on a lathe, and have a few different thread pitches around, then just wind magnet wire down in the groove to get what I need "on demand." It's easy to do the winding and makes a nice, uniform-looking coil. I've used that technique to make sets of coils for reasonably sharp cutoff bandpass, lowpass and highpass filters with very low distortion that I've used to characterize the distortion performance of amplifiers and the like.

Sorry that I don't have a better source of ready-made coils...maybe someone else has.

Cheers,
Tom

I usually design my filters to work reasonably well with lowish Q
inductors, say 100, so that I don't have to ever worry about the
actual Q. My rough measurements is that a Q of 100 is reasonably
reached using ferrite toroids not too far off from their optimal
frequencies etc. But some have done very good measurements of many
different coil types in search of extremely high Q inductors, the best
writeup I know is at:

  http://w7zoi.net/coilq.pdf

His conclusion was that Q's of 300's over an octave or two on ferrite
cores are very practical.

Other experiments and measurements he does go through Litz wire, Litz
rope, spider coils, etc. achieving some spectacularly high Q's.

I don't think any of this helps your "off the shelf" requirement, but
ferrite cores work well within their frequency range.

Tim N3QE

I think that the way to answer a question like this is to try to find
written material which originated as close as possible in time to the
introduction of the term in question. Wikki entries should give
references to original material, but of course those are not always
easy for everyone to find, and to study.

The best that I can do in the way of original references with the books on my shelves is to quote from the 'Admiralty Handbook of Wireless Telegraphy 1931', HMSO, London, 1932. On page 721 is written - '... This use of amplification at a frequency intermediate between that of the incoming signal and an audible frequency gives this circuit its name of super-heterodyne, or supersonic heterodyne receiver'.

The discussion goes on to describe an Admiralty receiver having an IF frequency of 30kHz, which is just what you would expect a supersonic frequency to be. To my mind this settles the question. Andy G4OEP

On Apr 20, 7:34=A0pm, David <DavidBR...@gmail.com> wrote:

> Looking for Crystal Radio Receiver Circuits, that have a voltage
> quadrupler to increase headphone volume without batteries or AC power.

Hi David - I think this idea will not work well for the reasons others have already given - (a) the forward voltage drop of the diodes (2 instead of 1) which means that you must have an rf signal of around 1.2v instead of just 0.6v before you hear anything at all, and (b) the question of the availability of power. A quadrupler will not increase the very small amount of power picked up by the aerial.

However, all is not lost. Other enthusiasts have been at work with a crystal set which uses a 'zero gate-threshold' FET as a form of passive synchrodyne detector. The incoming signal opens and closes the conducting channel of the fet at the same frequency as the signal applied to the earphones through the channel (they are both the same signal). This give synchronous mixing and hence detection of the rf envelope. The advantage is that the fet has low and high impedances in the right places (low channel impedance, high gate impedance) and so is highly efficient.

Forgive the long posting, but here is something copied from the GQRP Yahoo group, with references. Andy G4OEP

Hi to everyone on the list,

For those who have been following the "High sensitivity Crystal Set" and "More ham xtal set DX heard tonight on 80m" threads on this list I should like to share my recent experiences/observations using the ALD110900A device as a synchronous detector/crystal receiver.

The high sensitivity crystal set was featured again in the current Rad-Com (June 2007 edition, page 60) and the RSGB have made available a limited number of the ALD110900A devices on a first-come-first-served basis via RSGB sales. I obtained a small number of the ALD110900A devices so I could compare the performance to the 2N3819 jfet which I had been using in my version of the receiver based on the design by David Cripe (NE4AM) in his article "Nostagia For The Future" (Amateur Radio Today, Dec. 1995 pages 14-16) a copy of which can be found on this web page...

http://members.wideband.net.au/gzimmer/XtalSets/Detectors/FET1.html

The article referenced above was the inspiration for the more recent article in the January edition of QST, a copy of the QST article appears here...

www.arrl.org/qst/2007/01/culter.pdf

Observations/Comments:
I found the best results are obtained using the design described by David Cripes (NE4AM) in his 1995 article. His use of two tapped tuned circuits (band pass filter arangement) permits precise matching of both the antenna and the load, both of which are vital for best crystal set performance. In operation I found the receiver to perform very well with resuls comparable to a BC receiver, seperation of stations was readily achieved with good volume and loud enough for this "deaf old coot" to be able to listen to news broadcasts etc and understand what was being said. The antenna used is about 60 feet of wire and a central heating system counterpoise. My receiver shares the two 4 inch diameter coils used in the NE4AM design, it also shares the jfet (2N3819) with gate bias as described by David in his article.

The June Rad-Com article does not seem to place enough emphasis on the importance of matching the ALD110900A sorce/drain impedance and load (headphones) to the tuned circuit. My opinion is that best results are obtained with a good selection of tappings on the coil as described by NE4AM. The ALD110900A (or jfet plus negative gate bias supply) circuit demonstrates its superior performance over the OA81, OA91 etc style detector circuits when detecting weaker signals. Signals which are simply inaudible to the OAxx style detectors are rendered audible by the ALD or jfet synchronous detector design. The ALD or jfet design definately offer better performane for "crystal set DX for 80 Mtrs" or other similar applications.

I note that in both the January QST and June Rad-Com articles they used a low impedance telephone earpiece via an autotransformer for matching. In the Rad-Com article they said that "an old pair of Hi-Z headphones" was substituted for the low-Z earphone/autotransformer with no noticable improvement. I can only conclude that the "old pair of Hi-Z headphones" must have been very poor quality or had weak magnets, in my tests substituting my pair of "old Hi-Z headphones" into the circuit made a very significant difference. I tested several low-Z telephone earpieces (all worked) but the Hi-Z phones (4000 Ohms) consistently outperformed the low-Z units. Its also worth pointing out that the difference was most notable on weaker signals. On strong (local) signals the difference was much less obvious. I currently do not have a crystal earphone to test with but I suspect a crystal earphone would also outperform most low-Z earphones/matching transformer configurations.

And finally:
I would strongly advse anyone who is thinking about experimenting with this form of synchronous detector to first read David Cripes (NE4AM) article as a starting point and also give serious consideration to using a 2N3819 jfet plus adjustable negative gate bias supply in preference to the ALD110900A device. The only significant advantage I can see with the ALD device is that its zero Volts gate threshold avoids the requirement for the seperate negative gate bias supply required by the jfet arangement and thus saves a few components.

The RSGB are currently offering the ALD110900A devices for 4 UK pounds each (including UK postage) but if you already have a 2N3819 (or similar N-ch' jfet) in the junk box then try that first with an adjustable negative gate supply and evaluate the circuit for yourself before spending your 4 pounds. One additional advantage of the jfet plus negative gate bias approach I have found is that by making the bias adjustable (front panel control) you can improve performance/sound quality on strong signals. The bias point for best sensitivity and lowest distortion (on stronger signals) are not the same so the ability to make bias adjustments "on-the-fly" is an advantage.

Conclusion:
If you are building a crystal set for the "local" station(s) then I see no real advantage in bothering with the syncronous detector

approach but if you want a crystal set with highest possible performance then the syncronous detector plus tapped coils (for matching) gives outstanding performance.

I wonder, has anyone else on this list experimented with the ALD devices and if so what are your experiences?

73,s to all on the list.

Des (M0AYF G-QRP 9788)

Bill.
I built one of those several years ago. Plans came from a CQ magazine
article some years before. I couldn't get it to work very well back
then. couldn't get both circuits to tune to the same frequency, even
though it was built symetrically. A week ago, I brought it into the
shack from the shop and tried it again, using my 160 meter lazy quad
antenna. Still couldn't figure any way to get both sides to tune and
track together.

Looks nice and someone may have gotten it to work, but for now, it's
going back to the top shelf in the shop.

Paul, KD7HB

Sorry.  Frankly I've never seen one but I guess you could lash something
together easy enough.  May try asking over at the Rap-n-Tap forum.  If
anybody knows of one that group would surely know.

Rgds,
Bill

<aj-smith@blueyonder.co.uk
Tim Shoppa

> A terminology question I suppose about the derivation of the term
> "Superheterodyne" more than anything else:

I think that the way to answer a question like this is to try to find written material which originated as close as possible in time to the introduction of the term in question. Wikki entries should give references to original material, but of course those are not always easy for everyone to find, and to study.

** All one had to do was follow up on the "external links" at the end of the superhet Wiki

http://en.wikipedia.org/wiki/Superheterodyne_receiver

the very first one of which is:

http://antiqueradios.com/superhet/

Then go to footnote #11:

" Armstrong, "A New System of Short Wave Amplification," Proc. I.R.E. 9 (Feb. 1921), pp. 3-27. QST 3 (Feb. 1920), pp.5-9, 13.
This paper uses the term superaudible heterodyne, from which superheterodyne is derived. The British tended to use supersonic. Incidentally, the first use of the word superheterodyne that I have seen, is in QST for March 1921 (p.41) but evidently from the context it was in common use by then. "

Note the reference to " superaudible heterodyne " is from 1921 and Armstrong himself !!

Also it explains how the Poms (Armstrong was an American) liked to use "supersonic" in relation to those frequencies above the audible range.

The best that I can do in the way of original references with the books on my shelves is to quote from the 'Admiralty Handbook of Wireless Telegraphy 1931', HMSO, London, 1932. On page 721 is written - '... This use of amplification at a frequency intermediate between that of the incoming signal and an audible frequency gives this circuit its name of super-heterodyne, or supersonic heterodyne receiver'.

** Fine, but that book is ten years later and has no direct connection to Armstrong's invention.

The discussion goes on to describe an Admiralty receiver having an IF frequency of 30kHz, which is just what you would expect a supersonic frequency to be. To my mind this settles the question.

** The Q was settled by the first couple of replies Shoppa got here - but he simply had no interest in having one of his mad, pet theories proved wrong so easily.

Shoppa was trolling as usual and no simple facts were not gonna spoil his puerile mischief.

..... Phil

Perhaps you've heard of the Colorburst Club, that elite band of 80M
hams that hang out around the colorburst frequency using homebrew rigs
and crystals scrapped from old TV sets.

Now is your chance to become a part of a group so much more restricted that perhaps you've never heard of it before. You see, 14.31818 is a standard microprocessor clock frequency, and consequently there are surplus crystals available for it, right in the middle of the soon to be active twenty-meter amateur band. And you can join the specialized and esoteric bunch who hang out there.

All you need to do is send me $1 for your pair of 14.31818 MHz crystals, and you can do with them what you like. You can use them in your own homebrew QRP rig, or in an exciter driving a commercial transmitter to the legal limit. There's no end to the fun you can have when you have the power and the glory of being able to hang out with the best of the best on 14.31818. These crystals are made of genuine quartz, carefully A-T cut by anonymous and unknown craftsmen in a distant land, and then lapped to frequency with actual abrasives. You can use them to talk anywhere in the world.

Once you're on 14.31818 you'll be one of a tight group of people so secret that nobody knows who they are. Other clubs issue certificates of membership, but the 14.31818 club is SO SECRET that we won't give it away that you're a member by issuing a certificate. Only you will know for sure that you have the honor of being a member.

Is this whole thing actually a ploy for me to unload a lot of surplus microprocessor crystals? Of course. My wife is threatening to throw them out if I don't get them out of the living room. But that in no way diminishes the importance of this club. So don't delay, send your money now.

Was just wandering if anyone has used or experimented with television
IF, Video and Detector coils, most are slug tuned coils that have a
few uh to several hundred uh, some are sheilded some are not, i have
about 500 that i bought years ago, a lot of them look very close too
the old loopstick type coils, looking for
ideas.
Thanks David

I got beat up on my last reply offering comments....but, whatever.

The small slug tuned HF coils in cans really have no place in crystal radio circuits. However, the long ferrite rod loopstick coils are quite good and are popular.

I'll offer an invitation to   http://theradioboard.com/rb/ if you aren't familiar with the site. You should be able to scrounge up some additonal suggestions there.

Many years ago I converted a CM-1 capacitance meter to solid state using a 555 osc in place of the tube circuit. I no longer have the meter or the schematic I developed. I was wondering if anyone else had done this hoping I would not have to reinvent the wheel again. Knowing the osc frequecies for the various ranges whould be a huge help at giving me a starting point. Otherwise I will probably have to borrow a function generator.

They'll have very low Q, and therefore not really be suitable for a crystal radio, where low-Q coils fight your ability to get good selectivity without burning up all your signal before it gets to the headphones.

There's a whole bunch of _other_ cool things you can do with them, just not Xtal sets.

I tinkered around a lot with crystal radios back when I was a kid. It seemed that the most important thing was matching the impedance of the radio to the antenna. This is much more critical on crystal set than a modern superhet The only ham in the county impressed me very much with what a crystal set could do if properly matched to a good antenna system. He had worked all the states and a lot of the countries using a crystal radio as his rx. I do think he kind of cheated though by finding the signal on his regular station rx and then listening for it on the crystal set.

Unfortunately, the *Q* of those coils will be much too low for effective use
in crystal receivers.  The best results I've had with "no power" receivers
involved the use of FET detectors and /very/ High-Q coils.  The inductors
usually have to be large diameter air-cored, but you can get away with toroid
or ferrite rod types if you can accept poorer results.  It's quite
illuminating to browse the offerings on the web.

How about making an Air Core Toroid. That can be made using a wax core.
Then after winding it,
some QDope or something in strips to hold the windings and then melting
the wax. Or maybe a foam
plastic core.

Double conversion may be thought to be passe an awful lot of sattelite
TV receivers are double conversion or triple conversion.  Think LNB.

What would be a good Q range for AM broadcast & Shortwave bands.
Another thing is that a lot of these coils have only one coil on a
form like an adjustable loopstick, maybe i'll never know unless i try
them. Holding them next to each other they look alike.

Have used glue from a hot glue gun before, the coils will never move
once the glue sets.

There was a manufacturer in the 20s that used a coil like that. Thorola
- they called them donut coils. Looks like they just wound them on a
small form, maybe 1 inch, and then slid it off and bent it around
afterwards into the form of a donut.

Never heard any comment yeah or nay about their efficacy.

I think the best one I ever made used an oatmeal box for a form. Big air core coils seems to be the way to go. I built a kit that used a pair of loopstick coils and the best I could ever do wiith it was a couple of local stations. I think it was a Heathkit. A good RF ground seemed to benifit the receiver more than the antenna. Back in the day my father had a service station with about two acres of concrete out front. I was able to connect into a ground point that hooked it up to all the wire and rebar in the concrete.

Jimmie

>What would be a good Q range for AM broadcast & Shortwave bands.

If your _loaded_ Q is 100, the -3 dB bandwidth at 1 MHz would be 10
kHz (i.e. +/- 5 kHz from the carrier). The question is, what should
the _un_loaded Q be ?

If you have a full sized antenna, the signal strength would be
sufficient even with an unloaded Q of just 100-200.

At the middle of the HF band (10 MHz) a loaded Q of 1000 would be
required for a single station bandwidth and quite large helical
resonators would be required to get a usable unloaded Q without
damping the resonant circuit Q too much.

Paul OH3LWR

What Paul didn't mention is that the ratio between the unloaded and loaded Q is pretty much the ratio between the energy coming from the antenna and the energy that's wasted in the tank.

I.e. if your unloaded Q equals your loaded Q, then you're using up _all_ the energy in the tank, and there's none left over for your headphones.
  If your unloaded Q is 200 and your loaded is the 100 that you'd want for AM reception, you're using as much energy heating up your tank circuit as you are using to drive your headphones.

So insanely efficient tank circuits are a necessity for a crystal set.

I fully agree with this. With a Qu/Ql ratio 2:1 you end up with only 6
dB insertion loss.

However, the antenna capture area and hence the captured power (for a
constant field strength and hence constant power density) is inversely
proportional to the square of frequency (-6 dB/octave).

While a 1/2 wavelength dipole might be sufficient to feed a crystal
detector at 1 MHz, a 1/2 wave dipole at 10 MHz will unfortunately
produce only 1/100 the power.

There isn't much of a market for this stuff anymore, at least not since
the days of cloth-insulated wire :-)

Since it's for a receiver, how about building a Q-multiplier? Ok, many
youngster will scoff at that as being "archaic" but those things can
really rock.

To put some numbers on what Paul suggested:

If I want an unloaded coil Q of 2000 at 10MHz, I'd expect to need a coil about 5 inches (13cm) diameter and 10 inches (26cm) long--or similar. That assumes no loss to radiation. If I shield it to make a helical resonator, the Q will actually be lowered slightly, though such a large coil may have enough loss to radiation that it would be a wash between turning it into a helical resonator or leaving it in free air. Of course, with the shielding, it's less susceptible to changes in the environment around it. Anyway, the shield for a helical resonator should be a couple times the diameter of the coil, so it's a rather large arrangement anyway!

If you have very sensitive earphones (and sensitive ears!) and a good antenna, what may matter more than keeping the loss down to an absolute minimum is getting rid of interfering signals. A single-tuned circuit with 10kHz -3dB bandwidth offers only 20dB attenuation of a signal 50kHz away, and a signal 200kHz away is attenuated only about 32dB (assuming I didn't mess up my mental arithmetic). That's not a lot if you live in a metropolitan area with several stations nearby, and you want to hear the ones from far away. You can make the tuner with two or even three tuned circuits that are properly coupled, and get much better attenuation of those unwanted signals. But more tuned circuits means more loss in the tuner, too, even if you use high Q coils.

It's a really good idea to check out what others have done to advance the art of winding high Q coils for AM broadcast band frequencies, and of the circuits to use those coils to best advantage.

Cheers,

Tom

I second that motion (since I'm not doing the work...).

I had thought of suggesting it, I should have done so.

No way you'll ever see 2000 Q at 10 Mcs. Can't happen. Some guys are approaching 2000 at 1 MC BCB but there's lots of expensive hoops to jump through to reach that point. Simply cannot be had at 10 Mcs. 200-300 on a good SW coil is about all that can be achieved.

Indeed. But that agreed to there's no method to make the same numbers and techniques work at 10 Mcs. You really cannot achieve the numbers on SW as you can BCB given the 10x frequency difference.

Unless you live very near an international SW broadcasters, how do you expect to get any usable amplitude modulated signal in the middle of the SW band for your crystal set ?

To make the situation even worse, the power delivered by a matched dipole at 10 MHz is only 1/100 (-20 dB) of the power delivered by a matched dipole on 1 MHz due to the antenna capture area.

Actually, I was thinking in the paragraph you quoted more of MW broadcast, but since you mention SW: I have it on good authority that European SW broadcasters put 7MHz signals into the East coast of the US at levels up to close to 0dBm into a receiver's antenna terminals when the skip is right. That's using an antenna with a bit of gain over a dipole, but nothing fantastic. (That level gave me a goal for strong-signal handling for an HF receiver I recently put into production.)

Cheers,
Tom

Interesting comment.  In the filters I build for test fixtures, I use
air-core coils that are about 1" diameter and 1" long, and they give
me Qu in excess of 300 at 10MHz.  For what I do, I don't need Qu up in
the thousands, and don't have room for really big coils, but can you
give me a reason I shouldn't expect Qu to scale linearly with size up
to the point where radiation losses become significant?

Can you tell me why I should think that the inductance calculator at
http://hamwaves.com/antennas/inductance.html is not giving me accurate
results when I put in, say, D=3D130mm, n=3D20, l=3D260mm, d=3D7mm, and
f=3D10MHz?  It agrees with other independent ways I have to estimate the
Qu of the ~1 inch coils I build, and those coils measure within
engineering tolerance of the estimates.

When you go to very large coils like this, you have to be careful
about the self-resonance becoming too low, but in the example above,
it's (barely) OK at 10MHz.  (Actually, you better be careful about the
self-resonance of any coil...)  Fewer turns of larger diameter
"wire" (tubing:  cheaper, and easier to work with) can yield about the
same Qu and a considerably higher self-resonance.

Cheers,
Tom

Self-capacitance (ultimately self-resonance) is always a contributing factor that prevents coils from achieving their maximum theoretical Q. Estimating coils whose Q is going to fall in the 200 range for other reasons is relatively easy but that doesn't mean you can scale upwards proportionately.

I build air coils in the 3 inch range along the lines of what is pictured here, http://www.sparkbench.com/homebrew/grebe/cr18.html

They only *measure* in the 250 range. Silver-plated wire could certainly improve a coil of this size but no way would you achieve numbers like 2000.

Hi All,
i am looking for a datasheet for a transistor in a TO 5 Case with a Motorola logo on top.
Label: 1.line is SS3693
        2.line is 836
May someone have an old Motorola databook or something like that and can make a copy for me.

Thanks and vy73 de Herb oe5brl

Remember that his previous receiver invention, the regenerative detector, would produce an audible heterodyne when used in the oscillating-detector mode (for reception of CW, not AM signals). So it would make sense for him to think of his new principle as producing a supersonic heterodyne (IIRC around 50kHz or so).

And then there's the super regenerative detector, a regenerative detector which is driven into and out of oscillation at (typically) a supersonic frequency.

Mike

Yikes, 210V sounds high. I just took a look at the old 1985 databook
from TI. It does not state an abs max off-state voltage but under
recommended operating conditions it says 60V. If memory serves me right
mine used to run around 150V.

This datasheet says 60V minimum and it appears there are zeners built in
that limit what the 74141 output transistor sees:

http://wiki.cecs.pdx.edu/pub/JoeProjects/NixieClock/74141.pdf

Probably that zener is low enough in voltage not to fry the transistor
yet high enough that the nixie element will extinguish. BTW there are
lots of 74141 on Ebay for around $0.50-$1.00 in medium quantities. Looks
like they are from Russia.

One can write just about anything so that it looks good and authentic. :-)

There is plenty of rather authentic information on Edward Howard Armstrong, including scans of Armstrong's patents.

As to the words "supersonic" and "subsonic" I doubt that those were coined
prior to around 1930, rather long after the superheterodyne came into being as the very model of a modern major receiver structure.

Argument over the 'super' prefix/designator would come a cropper on things
like the super-regenerative receiver which use a sort of burst oscillation at
frequencies quite higher than young adult hearing maximum of 15 KHz, i.e., "supersonic" in terms of frequency. In aerospace, "supersonic" is a term for going faster than the speed of sound.

As to "typically converting the signal frequency below the range of tuning," that WAS true but it applies only to most superhets that were designed prior to WWII (at least 60 years ago). Those mixers used only the difference frequency output while the sum frequency output just dissipated internally. That changed with UP-conversion, notably in Collins Radio designs for their lowest selectable bands, then in the first wideband spectrum analyzers covering a full GHz in one sweep. Those early spectrum analyzers would up-convert 0 to 1 GHz to a 2 GHz first IF, then down-convert from there. 2 GHz is so far above 'supersonic' that it would be a misuse of it.

> Somewhere there's a bunch of people who spend their time correcting

> the little corners of arcania that I live in.

There's also a lot more folks who just vent their frustrations on everyone else, such as Phil Allison (who's profile can't be accessed because he violated the Terms of Service on Google).

As to the ORIGIN of technical terms, speaking as a lifetime engineer and technician and worker IN engineering, it matters little as to etymology but a great deal more on the SUBJECT the word is referring to.

If anyone wants to think "supersonic" applied in 1918 to anything at all, then they are welcome to point out the "supersonic" aircraft of that time...made of pieces of steel, wood, wire, and fabric. :-) It was a long time between 1918 and 1947 when the first aircraft broke the 'sound barrier' (Bell X-1 piloted by Chuck Yeager).

One risk with such chips is that a nixie element occasionally reaches
strike voltage while the respective driver output is off. Or doesn't
extinguish right away when turned off. Then the dissipation in the 55V
zeners inside might be too much to stomach for the little chip.
According to the datasheet those things aren't really high voltage switches.

There was a type of circuit called the 'heterodyne', which is actually
just a direct conversion receiver.  Adding the IF stage made it a
'super' heterodyne.

Also remember the 'super-regenerative' circuit?  That was an improvement
over the regenerative receiver in that feedback could be increased past
the self oscillation point to get even more gain via the use of a
supersonic quench oscillator.  So maybe the prefex DOES refer to supersonic.

"AF6AY" = radio ham nutter

One can write just about anything so that it looks good and
authentic. :-)

** Shame how that leaves this retarded old ham out in the cold.

As to the words "supersonic" and "subsonic" I doubt that those were
coined prior to around 1930,

** So the clot has no idea what terms were in use back then at all - but
it suits him to pretend that he knows.

What a hee-hawing bloody ASS.

...... Phil

"Tim Shoppa the Wanker "
 Greegor the Geek
> What specifically are your complaints with this Wiki ?
>
> http://en.wikipedia.org/wiki/Superheterodyne_receiver

A 180 Kbyte article about a technology developed in the 1910's,

** Irrelevant when it was first developed - cos it is still current tech.

    The article is not pretending to be being a history lesson.

A smaller point, is that the language sounds a lot like it was written
in a language other than English and then translated.

** That is an utterly absurd idea.

   Smacks of paranoid schizophrenia.

   Shoppa has completely lost it.

.....   Phil

"Tim Shoppa the Shithead Troll "

> > Everyone ought to realize that "Wikipedia" data can be written by
> > ANYONE
>
> ** As are NG posts.
>
> The difference being that Wikis are full of checkable references and are
> subject to on-going correction.

The best Wikipedia articles are often filled with good checkable
references, but other times it sounds like they were written in a
foreign language and translated into English

** Only indicates your lack of comprehension.

Just because a Wikipedia entry isn't well-written or sounds awkward

** You are irrationally obsessed with style over content.

Mostly likely because you cannot comprehend the content.

Somewhere there's a bunch of people who spend their time correcting
and improving Wikipedia entries, and I think overall they are doing a
good job, but that doesn't mean the result is always devoted to my
interests.

** What a revolting, pompous little narcissist you are - Tim.

Just like anything else in this world, it's got workers and
it's got managers and they aren't always devoting their attention to
the little corners of arcania that I live in.

** I was much too kind earlier ....

It's not that the Encyclopedia Britannica is perfect either. I can
open it up to the very few subjects that I happen to be expert on and
find over-simplifications and a lack of cites to what I consider to be

the best references.

** Mere narcissism has just turned into full blown ego-mania.

Of course in academia I got real used to opening a journal and instead
of reading the articles, to go straight to the references and see if
they are quoting one of my articles :-).

** Wot a nauseating computer geek puke.

......   Phil

Hey OM:

What you claim may be true, but if I use a pair of 2000 ohm headphones
and have 100 millivolts into those phones, I would developed a power
into those headphones of 5 microwatts. Now if the voltage goes up 4
times to 400 millivolts the power developed into the phones is 80
microwatts. So it don't matter what the detector impedance is. The
headphones don't care what the impedance is, in this case.

Now if the detector impedance was 10,000 ohms then you have a
problem.

So basically is it optimized for say Edison electric to run a 50 amp
main to my house when I only use a 100 watt light bulb? The source
impedance is a lot lower than my 100 watt light bulb.

Don't forget a good ground connection also.

Hey OM

I know they still make 2000 ohm headphones, Philmore still makes them, then there is a crystal headphone.
A crystal headphone you can make yourself. It''s just a crystal microphone in reverse. I seen the QST article on how to make a crystal microphone.

But the best bar none, is a balanced armature headphones, those things are self powered, or so they say. And balanced armature headphones cost an arm and a leg too.

"Tim Shoppa = Autistic Troll "

The best Wikipedia articles are often filled with good checkable references, but other times it sounds like they were written in a foreign language and translated into English

** Only indicates an autistic lack of comprehension.

Just because a Wikipedia entry isn't well-written or sounds awkward

** You are autistically obsessed with imaginary flaws in the writing.

Mostly likely because you have gone quite insane.

Somewhere there's a bunch of people who spend their time correcting and improving Wikipedia entries, and I think overall they are doing a good job, but that doesn't mean the result is always devoted to my interests.

** What a revolting, pompous narcissistic pig you are - Tim.

Just like anything else in this world, it's got workers and it's got managers and they aren't always devoting their attention to the little corners of arcania that I live in.

** I was much too kind earlier ....

It's not that the Encyclopedia Britannica is perfect either. I can open it up to the very few subjects that I happen to be expert on and find over-simplifications and a lack of cites to what I consider to be the best references.

** Mere narcissism has just turned into full blown, autistic ego-mania.

Of course in academia I got real used to opening a journal and instead of reading the articles, to go straight to the references and see if they are quoting one of my articles :-).

** Shoppa's self delusions have made him a legend in his own mind.

When all he really has become is " history ".

..... Phil

Hay OM:

I wondered what the impedance of a crystal headphone would be. I guess just the capacitance and inductance of the wire going to the crystal. And at 1000 cycles that would be way up there.

I can bet for a certainty that 32 ohm headphones will be 32 ohms of impedance at 1000 cycles. Just think how much the inductance and capacitance will figure into the equation? Under 1% I bet at 1000 cycles.

Yes it does. And no, your math is wrong. Phones don't respond to watts.

In a simple crystal radio the voltage is gained by NOT loading down the preceeding circuit. If you load down a simple LC circuit with a doubler/quadrupler as opposed to 'one clean diode' then you lose more than you gain. And you take an additional hit on selectivity because the Q of the RF circuit becomes loaded excessively. Thats why the doubler/quadrupler schemes that look good on paper don't pass muster with xtal radio enthusiasts.

Detector impedance, headphone impedance are the meat and potatoes in "dx" crystal radio circuits. Its a house of mirrors, so to speak. Poor impedance match at the fones will kill RF selectivity, for example. Yes, you have to look at it that way.

Doesn't matter much with a Rocket Radio or a Cub Scout radio but if you get into the high end of xtal sets its very important.

Impedance of xtal phones is often in the 10s of k. But their efficiency
stinks.

```
Regular old-time "2k"  phones ohm out pretty close to 2k in DC
resistance and their impedance is in that same ballpark.  They are all
over the place nowadays .  May be fine on a regen set but suck horribly
on a crystal set.

The current limiting resistor going to the tubes is 39K. Im going to
increase that to 47K and see what happens. After putting in new chips
it may be months to a year before I see another problem with it. I
wish I knew what I was up against if I had a schematic, knew what the
voltages were supposed to be it would help greatly. I bought one a
surplus from where I work and from what I heard of its history it had
ths problem for along time. The second one I got ws at a hamfest and
it too seems to have the same problem. Could it be bad nixie tubes?

Jimmie

nixies are a burroughs 57505s and some other not readable type.
Ican make out the word "electronics" and the number "7341"
Interestingly these are the ones I dont have a problem with. Maybe I
have found my problem. Now to find a solution. Where can I find these
nxies?

Jimmie

Unlikely, when nixies go bad they become dim, then at some point elements fail to strike at all. It's just that the 210V you mentioned in another post sounds unusually high. Leaves a whopping 150V between that and the 55-60V zener in the output of the 74141. My nixies would light at that voltage. So if you'd have one that occasionally lit or stayed lit and drew, say, 3ma then that results in 150mW dissipation in a very tiny area of the chip ... phsssst ... phut ... gone. When pulling down to near GND the chips can sink that current forever but not if 60V are dropped.

But all this is speculation because we both don't know what kind of nixies are in there and what the voltage was designed to be.

"Tim Shoppa = Autistic Troll "

The best Wikipedia articles are often filled with good checkable references, but other times it sounds like they were written in a foreign language and translated into English

** Only indicates an autistic lack of comprehension.

Just because a Wikipedia entry isn't well-written or sounds awkward

** You are autistically obsessed with imaginary flaws in the writing.

Most likely because you have gone quite insane.

Somewhere there's a bunch of people who spend their time correcting and improving Wikipedia entries, and I think overall they are doing a good job, but that doesn't mean the result is always devoted to my interests.

** What a revolting, pompous narcissistic pig you are - Tim.

Just like anything else in this world, it's got workers and it's got managers and they aren't always devoting their attention to the little corners of arcania that I live in.

** I was much too kind earlier ....

It's not that the Encyclopedia Britannica is perfect either. I can open it up to the very few subjects that I happen to be expert on and find over-simplifications and a lack of cites to what I consider to be the best references.

** Mere narcissism has just turned into full blown, autistic ego-mania.

Of course in academia I got real used to opening a journal and instead of reading the articles, to go straight to the references and see if they are quoting one of my articles :-).

** Shoppa's self delusions have made him a legend in his own mind.

When all he really has become is " history ".

.....   Phil

The Burroughs cause problems? And someone replaced a few with other types? Getting a certain brand and type nixie will be tough. Most nixies offered these days seem to be from Russian sources. There is also a guy in NL who specializes in nixie retro clocks, he might know more. If you really can't find any, there could be a somewhat scientific solution:

Pop one each out of there and hang them onto a voltage source, with series resistor. Crank it up from zero, see where it lights, then turn it down and see where it extinguishes. Try at a somewhat elevated temperature as well. Then you'd have to get the supply voltage inside the counter to the sweet spot where it's nearly guaranteed that the 74141 will never sit with an output high (meaning 55-60V) and the segment still lit. This could be done by dropping the ones with lower striking voltage with a zener plus small bleeder.

Hmm... so a crystal radio would effectively perform better using a 1k<-->8 ohm audio transfer than just using the "traditional" crystal earphones?

Are crystal earphones called that because they're used with crystal radios, or because they really do have some sort of crystal in them (seems unlikely)?

Not at all unlikely :-) Crystal earphones are piezoelectric devices
- the small electrical AF signal produces a small mechanical
movement. These devices have very high impedances so are ideal for
extremely low power circuits such as crystal sets.
See also crystal cartridges for playing records, these were some
what chunkier and would produce a lot of output and a typical cheap
record player might consist of a crystal cartridge (pickup) driving
the grid of a tridode / pentode arrangement (EL86 I think).

Charlie.

The crystal earphone is called that because it does contain a crystal, similar to some microphones.

The crystal in a crystal radio is the diode that does the conversion from RF to AF. It started off years ago as a real crystal. A semiconductive mineral crystal, usually lead sulfide (galena) or cadmium sulfide.

The impedance of the headphone is pretty much meaningless.
The sensitivity is critical. Impedance matching can be done with
high quality audio interstage transformers. The most popular
headsets are made from sound powered Deck-Talkers used on
WWII era military ships. They have balanced armatures and
are extremely sensitive, and very low impedance.

Thanks Joerg

Im not sure if the 210 volts is the design voltage or if something is
wrong with the power supply. I added a zener to get it down to 180. At
180 I think the characters are a little less hazy looking and only
slightly dimmer. I guess I will just have to see how it goes.for now
and keep my eye out for a maintenance manual.

Jimmie

Hey OM:

That's a nice link. But nowhere could I find a diode double, tripler,
or quadrupler detector.

If it comes to that, old Longwave/Mediumwave superhet receivers
generated an IF for the LW band that was higher than the frequency of
the incoming signal. The IF was usually a frequency between the two bands.

Sylvia.

Not a bad article, except that he seems to think that cascading multiple
stages at a single IF improves image rejection, and that very high IFs
are much less common than double conversion. (Does *anyone* use double
conversion anymore? Spur city.)

I did a double-conversion superhet FSK receiver for Reuters, umm,
maybe 20 years ago. I used state-of-the-art MF10 filter chips. Just
after I did it, they dumped all their wireline FSK newsfeeeds for the
Internet. Pity, it was a neat design.

We may do it again soon, for a scientific instrument, more digital
this time.

John

The IF frequency is above the signal frequency, hence the "super" prefix.

There are also "homodyne" receivers, where the local oscillator is at the same frequency as the received carrier. These convert the input signal all the way down to the output signal in one step. This was an early idea, but until phase locked loops were figured out, hard to make work. It's used today in some microwave and optical systems.

I thought it was a contraction of "supersonic heterodyne".

At that time receivers were TRF and in many cases used reaction (i.e.
controlled positive feedback) to improve selectivity and gain. This
could be exploited to receive CW signals by advancing to the point of
feedback resulting in an audible heterodyne (whistle) at the output
whwn tuned close to a signal.

The supersonic heterodyne performed in a similar way but was
intentionally above audible range (i.e. supersonic) for amplification
at the intermediate frequency.

Ultrasonic of course, so it's been the wrong name all along.

Supersonic today means travelling faster than the speed of sound. The correct
word now would be ultrasonic.

So maybe they should be recalled ultraheterodyne receivers.

Was gonna recommend the same. Along the lines of good 'crystal radio' headphones some of the guys have found some of the little piezo devices make for a very sensitive, high-impedance DIY headfone project. I think one of the guys is selling them as a kit, with shooter's muffs included. Haven't tried them myself but the reports are very favorable.

Basically true but in fairness to the folks who have never tried it you
MAY get some additional volume on a reasonably strong local station.
You shoot your selectivity and ultimate sensitivity in the foot, though,
because of the extra loading on the tank. ie, not a DX set.

There's one circuit floating around that uses a dual center-tapped tank
(so to speak) with a diode on each side and their outputs are combined.
One fellow said it worked pretty well as a workaround for the
loading concern. Still not a DXers set but better than attempting a
voltage doubling detector.

Thanks all for the input. I managed to cut the voltage back from about
210VDC to 185VDC and the display still looks good, the change in
brightness was barely discernable. It may take a while to see if this
helped. What voltage do you normally run on nixies. I wish I had more
data on the nixies but I dont have a part number.

Jimmie

67715's have been out of production for a number of years now,
because their MOSFET counterparts are better: more linear,
higher gain, more efficient.

I realize it hurts when you can't just plunk in a part but in the end you'll feel better, honest..

I think we are possibly talking about different MOSFET modules. The one I specifically refer to for use at 1240-1300 MHz (RA181213G). The data sheet says it is designed for FM (NON-linear) but can be set up for linear use by setting Id with Vgg and controlling the output level with the input (RF) level. http://www.rfparts.com/pdf_docs/RA/RA18H1213G.pdf

It should work...it will just require a few additional components.

I also like the Neutrik's but at least with the connectors I've seen,
the insulators are thermosetting plastics that can melt under
soldering temperatures.

One of my pet peeves (extending back to polystyrene coil forms in my
childhood) is that I really really hate it when plastic starts melting
when I use a soldering iron in a fairly normal fashion. I will admit
that there are special cases where extra precautins must be taken, and
I will admit that sometimes I may be a little heavy handed with my
WTCPT (which is temperature regulated).

But I can also see a newbie (like maybe that QST reviewer) using a non-regulated-temperature soldering iron and getting frustrated with soldering simple connectors.

I really really like the Switchcrafts for their solid feel and unmeltable insulators. I admit that Neutrik et al are pretty good too, and I can put myself in the mindset of "be careful, don't melt it!" when I use them, but I just adore the Switchcrafts.

Radio Shack and Mouser have some other brands at differing price points and differing gold plating but I honestly have little to no feel for where they fall on actual usability. With any brand other than Switchcraft, I always have the fear that I'll pay extra money and end up with cheap crap. With Switchcrafts, I know that I'll pay the extra money but also know I'll never end up with cheap crap.

I do like some of the other Deltron-branded stuff from Mouser, especially their chassis punches.

This came up on one of the broadcasting groups a few weeks ago.

I suppose use of XLR connectors is rare in amateur radio but...

I've had problems with Neutrik connectors. On the cable connectors, I've had problems with the strain relief mechanisms breaking. On brand new ones, if you try to tighten them too tight. ("too tight" is to easy to achieve) On ones that have been in service for awhile, they seem to break with less abuse than Switchcraft. (in a field environment they WILL be abused)

On the chassis connectors, at least they used to use "pot metal" for the frame - and the frames would break. We made the mistake of using some for a side connector panel on a live truck, and within a few months they'd managed to push several connectors all the way through the panel.

They're probably OK when used in a situation where they won't be touched very often.

I share the disgust for connectors that melt when soldered in a normal fashion. Haven't had much trouble with that on 1/4" connectors but some on 1/8" and a LOT on RCA connectors.

A terminology question I suppose about the derivation of the term
"Superheterodyne" more than anything else:

Does the "Super" actually mean anything? Is there a Subheterodyne?

Traditionally superhets mix a higher radio frequency down to a lower
IF frequency, but certainly in the past few decades radios with IF's
above the RF frequency have become very common in broadband
applications, and those are still called superhets, not subhets :-).

Google turns up a couple hits on subheterodyne but other than one that
might mean "IF higher in frequency than RF" I don't recognize what
they mean..

I suspect that "Super" was more a marketing term than anything
else :-).

My recollection is that Armstrong used the term "supersonic heterodyne"
to note the fact that the beat frequency between the signal and LO
was "supersonic."

A superheterodyne can be Supradyne or Infradyne,
depending of the IF against the RF.

> I suspect that "Super" was more a marketing term than anything
> else :-).

I don't superthink so.

I saw that in Wikipedia too. I didn't believe it, it doesn't make
sense. Why not just call all radio frequencies and IF frequencies
above 20kHz "supersonic"? Then all radios (*) are supersonic, and
we're back to super meaning nothing at all.
```

(*) OK, I know about lowfers and there is submarine RF communication
below 20kHz. If I listen in to that with a superhet is it then really
a subhet?

Reminds me of a Simpsons episode where Bart and Homer are arguing
about something, and Bart parrots what Wikipedia says on the subject.
Homer says in a deep resentful voice "We'll fix THAT when we get
home!"

Tim.

If you want to file a new patent for old stuff you could try
subheterodyne and it just might sail through :-)

Oh wait, call it hyperheterodyne, has more glitz. Just like the
supermercados in Spain.

Possibly because heterodyne receivers mixed to sonic frequencies.

John

I think we're going to be doing a superhet receiver soon. Maybe we'll
do it in an FPGA!

:-)

Those actually called themselves supermercado a lot, probably the reason
why the real ones of the size of a Safeway had to notch it up one category.

I didn't really trust Wikipedia on this (it uses unusual language to
talk about perfectly conventional subjects) but I did find my December
1922 QST, and it says (page 11):

  In December, 1919, Major E. H. Armstrong gave
  publicity to an indirect method of obtaining
  short-wave amplification, called the Super-
  Heterodyne. The idea is to reduce the incoming
  frequency which may be, say 1,500,000 cycles
  (200 meters), to some suitable super-audible
  frequency which can be amplified efficiently, then
  passing this current through a radio frequency
  amplifier and finally rectifying and carrying on
  to one or two stages of audio frequency
  amplification.

To me that sounds a little less awkward and more natural than the
derivation that Wikipedia tries to draw.

Hi David,
I don't think it really works that way. The audio is level is dependent on
the level of the RF signal.
Get a long antenna and sensitive headphones.
Check the http://members.shaw.ca/ve7sl/crystal.html
and see the list at the bottom, check out Rap N Tap.
Mike

I don't have a circuit, but have seen where a transistor was powered by a
rectified radio signal to boost the audio signal. I think a seperate
antenna and tuned circuit was used on the strongest signal in the area.

If you measured all three at 1kHz, yes.

Otherwise you may find that the _effective_ L, C and R at 1kHz was just that -- effective, not actual.

If you are quadrupling the voltage at the headphones, then you are, of necessity, dividing the impedance at the detector by a factor of 16.

You only have so much power available at the antenna; a detector followed by an unpowered "voltage quadrupler" won't extract any more power than any other equivalently-well-matched detector, and so won't put any more power to the headphones.

If you really want to do this passively, and not rely on some near-by strong station for power, then you need to optimize your circuit and headphones for efficiency, and you need to get a _lot_ of wire into the air.

It is better to play with the design to achieve the desired matching between
the tuner, detector and headphones. Diodes have losses, and fancy

circuits like your suggesting will only multiply the losses, not the
voltage.

Pete

I assume you are talking about a broadcast receiver for frequencies
below 1600 kHz. At such frequencies and with a typical 500 pF variable
capacitor, the impedance levels for an LC resonant circuit is quite
high.

Loading it with a crystal detector and some low impedance (30 or less)
headphone will load the resonant circuit quite heavily, reducing the
output quite heavily.

In the old days, the typical impedance of a headphone might have been
about 2000 ohms, loading the resonant circuit much less. In order to
cause a similar loading to the resonant circuit using current

headphones, you need an audio transformer with 2000:30 impedance ratio
or 8:1 turns ratio.

>
> Does the "Super" actually mean anything?

** Refers to the term " supersonic frequency " - the general name for any frequency between the upper limit of the audible range (20kHz) and the lower limit of common radio transmission frequencies or "long waves" at about 150kHz.

> Is there a Subheterodyne?

** No.

> Traditionally superhets mix a higher radio frequency down to a lower
> IF frequency, but certainly in the past few decades radios with IF's
> above the RF frequency have become very common in broadband
> applications, and those are still called superhets, not subhets :-).

** The name now refers to any receiver that involves a frequency changer stage prior to detection.

If you want to know the meaning of any term, you have to study how PEOPLE used it - both in the past and the present.

Only complete fools and radio hams study the words themselves in isolation and try to de-construct them.

..... Phil

I did like the wiki bit about people using hundred-tube TRF receivers.

John

So, if a basketball player from a certain team in Seattle were flying on the Concorde, and listening to a particular brand of antique radio, it'd be a supersonic SuperSonic's Superdyne supersonic heterodyne?

The heterodyning of two signals was barely known around 1902 to 1904 when very early entrepreneur-experimenter Reginald Fessenden was fooling around in his lab trying to improve the sensitivity of early coherer-type detectors. Fessenden tried mixing the output of a very low-power spark transmitter with his simple receiver and reported getting a clearer tone from a distant station. Fessenden was keen on making himself known so he wrote that up and it was published.

However, by 1906 the first audion tube was made and in a few years later, some production units were available for experimenters, namely a very young Armstrong...who went on to start gaining fame with his regenerative tube receiver. By 1918, Amstrong was now a Major in the US Army and stationed in Paris with WW One having stopped. Armstrong remembered the Fessenden experiment and remembered the 'heterodyning' process of mixing low-level RF signals with higher-level RF (the 'Local Oscillator' as it became known), getting two extra mixing products out of a 'mixer' stage (sum and difference of the two main input frequencies). By now academics had gone into the heterodyning process in more detail with at least 14 years between Fessenden's experiment and Armstrong's tube version.

Armstrong's patent application promised an equal-selectivity at any antenna-input frequency, something not possible with TRF receivers, narrower at lower frequencies, wider at higher ones.

>I suspect that "Super" was more a marketing term than anything
>else :-).

Might have been had there been ANY real "market" for radios back then. Of course, anything RF done with vacuum tubes beat the pants off any crystal detector and spark transmitter, so it was definitely a 'super' thing. :-)

Actually, Ed Armstrong had a battle with various nations on the patent for his superheterodyne, at least a year or two later with someone in England and another in France. Patent suits would continue to dog Armstrong until the end of his life, probably causing the depression that, in turn, caused him to suicide.
Just the same, Armstrong had the chutzpah to promote his ideas and he is truly the father of FM broadcasting allowing high-fidelity music to any FM receiver. He was no slouch in getting organized and promoting himself.

There's a whole lot of material on Edwin Howard Armstrong at several websites, reachable through members of the Radio Club of America, the oldest association (since 1909) and still going.

The three basic forms of modulation of a carrier (amplitude, frequency, phase) were worked out by John Carson of AT&T in 1915, before Armstrong got going on his 'superhet' idea. Whether or not Ed saw those is unknown, but Carson had them worked out already.
Those very early 'radio' experimenters, from academics to amateurs, were very very busy in the first two decades of 'radio' existance, going from essentially nothing to several somethings. 'Radio' stayed a fertile field for scientific-engineering innovation for three more decades, spurred into a couple quantum jumps during the World War II years.

Reginald Fessenden sort of faded into the woodwork after his famous "Christmas Eve" sound broadcast of 1906...using a spark transmitter whose antenna wire was modulated by a special carbon microphone! I doubt that any AM broadcast station ever tried to use that system since so it was an early curiosity in radio history. Armstrong's name spread and so did his inventions...not just the regen or superhet, but also the super-regenerative for high HF and into VHF (note the 'super' addition by the extra oscillation) and, of course, to FM broadcasting.

73, Len AF6AY
